the BUSINESS SITUATION

CHART 1

U.S. Department of Commerce, Bureau of Economic Analysis

72-4-1

ECONOMIC activity expanded briskly in the first quarter. Preliminary estimates show strong gains in residential investment, investment in producers' durables, Federal defense purchases, and purchases by State and local governments. There was also a sizable increase in consumer demand, whose sluggishness has been a key to the slow rate of economic recovery during the past year or more. On the other hand, the data now available show that inventory accumulation slowed in the first quarter from the already low fourth quarter rate. Despite that slowing, total gross national product (at a seasonally adjusted annual rate) increased slightly more than \$30 billion, or about 11 1/4 percent. This was the strongest gain in 4 years, except for the first quarter of 1971 when the economy was rebounding from the 1970 auto strike.

The rate of price increase in the first quarter was substantial, with the implicit deflator for total GNP up 6 1/4 percent (chart 1). GNP in real terms, grew at an annual rate of 5 1/2 percent, not far below the strong advance registered in the fourth quarter.

The pay raise for Federal workers that went into effect in January was a factor working to boost the GNP deflator in the first quarter. Such raises have the effect of increasing the price of government output as measured in the national income and product accounts. The deflator for private output—GNP less the output of general government—increased at an annual rate of 5 1/4 percent in the first quarter, compared with 1 1/4 percent in the fourth. In real terms, private output grew at a rate of 5 1/2 percent, a bit

slower than in the fourth quarter. It appears that private output per man-hour increased, but its growth rate was evidently slower than in the fourth quarter.

Residential investment strong

Outlays for new residential construction increased a very substantial \$4 1/2 billion in the first quarter, well ahead of the gains in the third and fourth quarters. In good part, the acceleration of spending reflected the very strong increase in housing starts. The starts rate averaged almost 12 percent higher in the first quarter than in the fourth; this was the strongest quarterly advance since the initial stages of the current housing boom back in 1970. Starts in March were at an annual rate of almost 2.4 million units, down from the extraordinarily high rate of nearly 2.7 million in February. For the quarter, starts averaged 2.5 million units.

The starts rate in recent months has been rising very rapidly and this seems to have resulted in an upgrading of forecasts of total 1972 starts. The common expectation now is that starts this year will be about equal to or even somewhat above the 1971 total of 2.1 million, rather than somewhat below that figure. However, it is still generally expected that the starts rate will decline during the course of 1972—that is, that the total for the year will be below the first quarter rate of 2.5 million units.

An uptrend in vacancies is one factor contributing to expectations that starts will move lower during 1972. The vacancy rate for rental units was stable in 1970 and early 1971, after several years of decline; however, in the second half of last year the rate was above

year-earlier levels, especially in the South and West. Financial conditions are another factor bearing on the outlook for residential investment. It was pointed out in last month's SURVEY that the low in short-term interest rates had evidently been passed. Developments since mid-March corroborate this, as money market rates have continued to rise, the banks' prime lending rate has moved higher, and upward pressures on rates in long-term markets have become more pronounced. The flow of funds to finance residential construction remains large, but the uptrend in the structure of credit costs is neverthe-

less a potential source of difficulty for mortgage markets.

Business investment up

The latest BEA survey of plant and equipment spending expectations, taken in February, pointed to a large increase in outlays in the first quarter. Actual first quarter spending will be covered by the May survey. The available information on capital goods shipments suggests that the first quarter increase in investment may not have been quite as large as the survey findings intimate. Also, the available data on nonresidential construction suggest little strength during the quarter. Nevertheless, the preliminary estimate of the nonresidential fixed investment component of GNP puts the first quarter increase at \$5½ billion, a large gain. Outlays for structures are estimated to have increased little, but investment in producers' durables rose substantially; demand for trucks was particularly strong.

The strength of truck sales is undoubtedly related to the recovery of economic activity to date and to expectations of good growth this year, as well as to the restoration of the investment tax credit and, for light trucks, repeal of the 10 percent excise tax. Even so, truck sales seem exceptionally high. One reason may be a surge in sales of trucks—mainly lightweight pickups and panel vans—to the consumer market. In the GNP all truck purchases are treated as business investment in producers' durables. However, quite a number of the light trucks are evidently used partly or entirely for nonbusiness purposes and a surge in such non-business demand is likely a factor in recent truck sales. (For autos, there is some information on which to base an allocation of output between business investment and consumer buying, and such an allocation is made in estimating those two GNP components.)

Manufacturers account for a very substantial part of the expected growth of business capital spending this year. The gain expected by durables producers is especially sharp—almost 14 percent, according to the February BEA survey—following a 10½ percent decline

last year. The recent strengthening of manufacturers' output, as measured by the Federal Reserve production index, is a good omen for the realization of manufacturers' spending plans.

The preliminary March estimate of the index of manufacturing production shows increases of about 0.6 percent in the total and in durables and non-durables output separately. For the quarter as a whole, the production index for manufacturing was up 1¾ percent from the fourth quarter and the index for durables manufacturing was up 2 percent. Among the factors contributing to these good gains are continued growth of consumer goods output, an upturn in steel production following declines last year when strike-hedge stockpiles were being worked off, an upturn in business equipment output following more than a year of stability, and apparently a stabilizing of defense equipment production following three years of shrinkage. However, despite the fairly strong recent growth of output, the estimated rate of manufacturing capacity utilization increased less than 1 percentage point in the first quarter and remained below 75 percent.

Increase in government purchases

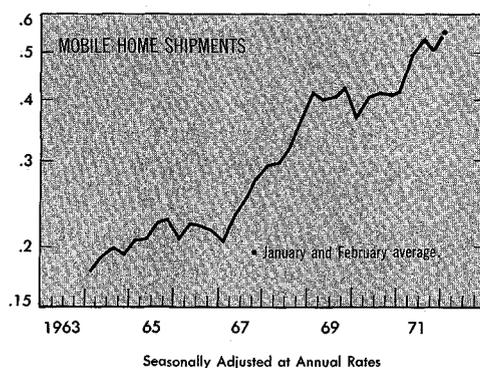

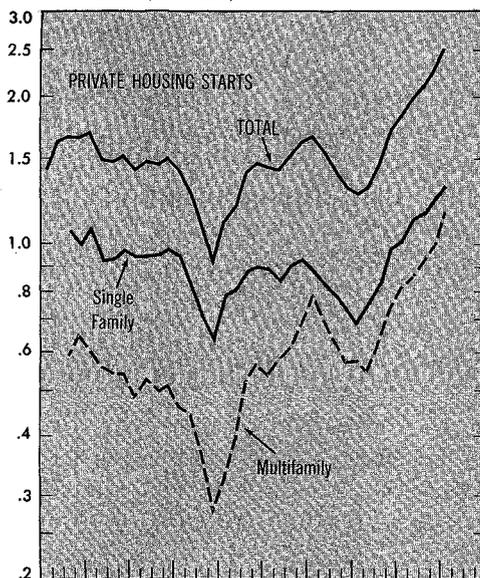

Federal purchases of goods and services increased in the first quarter at an annual rate of \$5 billion, of which \$4½ billion was in the defense category. Purchases were swelled by pay raises for both military and civilian employees. Apart from pay raises, there was a significant increase in defense purchases but nondefense purchases declined—because of a steep drop in crop support purchases.

The general raise for Federal military and civilian personnel that went into effect in January boosted the level of Federal spending on goods and services by about \$2 billion, of which over \$1½ billion was in the defense category. In addition, the level of defense purchases in the first quarter was boosted more than \$1 billion by virtue of the fact that the mid-November military pay raise (a pay adjustment related to the move toward a "volunteer army") was in effect for only half of the fourth

CHART 2

Residential Construction and Mobile Homes

Million Units (Ratio scale)

Seasonally Adjusted at Annual Rates

Data: Census

quarter but for all of the first. Altogether, pay raises accounted for roughly \$2½ billion of the \$4½ billion first quarter increase in defense purchases. The remaining \$2 billion marks a shift from the downtrend of the past two years or more—a shift that was indicated in the January 1972 budget document. In the fourth quarter, defense purchases excluding the pay raise were unchanged; before that, purchases excluding pay raises had been on a downtrend since 1968.

At the State-local level, the available evidence indicates that spending growth has picked up recently after a period of slow expansion last year. The preliminary estimates put the first quarter increase in State-local purchases at \$4½ billion. This was a bit larger than the increase in the fourth quarter and well above the average of only \$2¼ billion in last year's first three quarters. Compensation increased sizably in the first quarter. Construction spending is also a factor in the recent strengthening. Unless the months just ahead see a sharper tightening of credit conditions than now seems likely, there should be a sizable increase this year in State-local construction spending. A recent forecast of construction contracts in 1972, made by the F. W. Dodge division of McGraw-Hill, pointed to strong increases in such categories as roads, bridges, sewers, and water supply facilities.

Increased consumer spending

Preliminary estimates show a \$13 billion increase in consumer demand in the first quarter. This is larger than had seemed likely on the basis of the evidence available through mid-March. February retail sales were subsequently revised to show an increase over January rather than no change, and the advance figures for March show a large increase, especially for durable goods stores. Early this month the results of the latest survey of consumer sentiment and buying plans were released by the University of Michigan Survey Research Center. The survey, taken in February, found a substantial and broadly based improvement in consumers' expectations about eco-

nomie conditions, and there was a sizable advance in the consumer sentiment index, which had been unchanged in last year's second half.

The increase in consumer spending in the first quarter was broadly based. Spending for food, which accounts for a little more than one-third of total spending on goods, increased fairly sharply because of higher prices. The sharpest increase was in spending for household durables, which had also risen quite strongly late last year. These increases in demand for furniture and other household equipment presumably reflect the ongoing boom in homebuilding. Spending on all goods other than new cars rose about \$7 billion in the quarter and the increase for services was a strong \$6 billion (chart 3).

Spending for new automobiles was little changed in the first quarter following a dip in the fourth. In unit terms, sales of new domestic model cars ran at about 8.8 million units (seasonally adjusted annual rate) in each of the year's first three months, a strong rate but one below the pace during the sales boom last fall. Sales of foreign cars rose to a rate of about 1.5 million units in the first quarter, regaining a 15 percent share of the market. Foreign car sales had declined in the fourth quarter, both absolutely and as a share of the market, after a very strong showing through much of last year.

Income and taxes

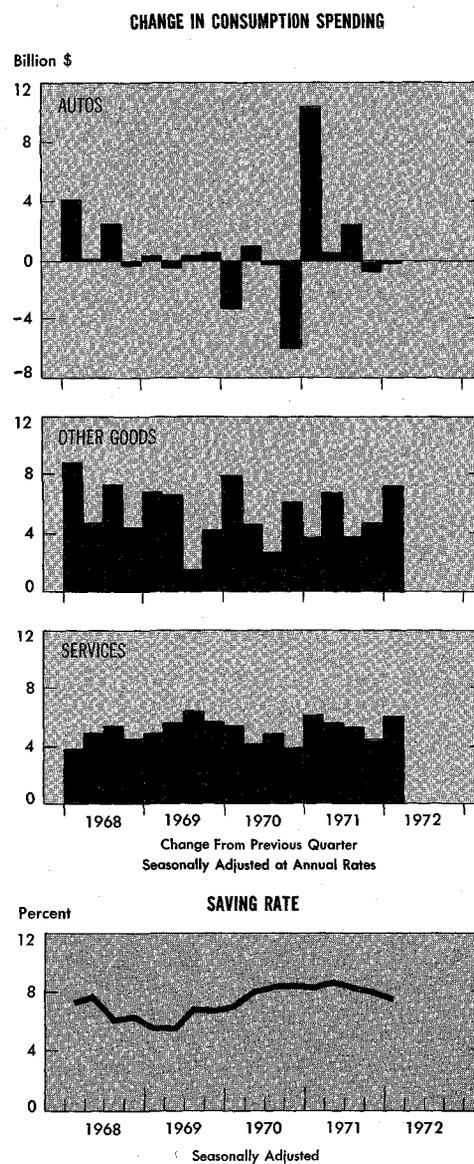

The sizable first quarter increase in consumer spending occurred in a period when disposable income was significantly dampened by overwithholding of Federal income taxes. The amounts withheld in excess of the amounts needed to cover personal tax liabilities are a form of saving, though one on which the saver earns no return. The overwithholding probably had an impact both on consumption spending and on personal saving (as defined in the national accounts), but it is reasonable to think that the impact fell disproportionately on saving. In the absence of the overwithholding, personal saving as defined in the accounts would undoubtedly have been higher and the saving rate would in all likeli-

hood have been above 8 percent, as it was nearly all last year. The saving rate actually calculated for the first quarter was 7.4 percent. Personal income increased an estimated \$23¼ billion and personal taxes \$12½ billion, of which the Federal Government received \$11 billion. Disposable income increased \$10¼ billion and the amount saved fell \$2½ billion.

When withholding schedules were adjusted in January, it was recognized that significant overwithholding would result if affected taxpayers failed to offset some of the impact by increasing

CHART 3

Consumption and Saving

U.S. Department of Commerce, Bureau of Economic Analysis

their exemptions for withholding purposes. It appears that relatively few taxpayers have taken the necessary action. To estimate the amount of overwithholding it is necessary to sort out the various factors that play a part in determining the amount of personal tax payments received by the Treasury. When this is done, it appears that the amount of overwithholding in the first quarter was at least \$8 billion (annual rate) and may have been larger.

This means that most of the \$11 billion first quarter increase in personal tax payments to the Federal Government was due to overwithholding. Treasury receipts of withholdings increased a bit more than \$11 billion, while there was almost no net change in payments of nonwithheld income tax and other taxes (mainly estate and gift). Given the increase in wages and salaries, the quarter's "normal" increase in withholdings would probably have been above \$4 billion. However, the estimated effect of the January 1 tax cuts (involving increased personal exemptions and deductions) was to cut withholdings about \$4¼ billion; thus, some net decline in withheld taxes was to be expected. Since withholdings actually increased more than \$11 billion, there is a gross increase of roughly \$12 billion to be explained. Easily \$8 billion of that is overwithholding. The rest may also be, although some of it likely reflects other factors.

Retroactive wages

While overwithholding was cutting disposable income below what it would otherwise have been, retroactive wage payments were boosting incomes. These payments were made following Pay Board approval. Some of the payments were of wages originally stopped by last fall's freeze; retroactive payments also occur because large bargaining units must obtain Pay Board approval before employers can start paying increased wage rates provided in new contracts. (Some contracts contain explicit provisions for retroactivity, which result in retroactive payments even if there is no delay in getting Pay Board approval.)

The basic source of wage and salary data used by BEA in estimating current personal income is the Bureau of Labor Statistics' monthly survey of nonfarm payrolls. The payroll figures collected in that survey explicitly exclude retroactive pay. This means that such payments must be specifically measured for inclusion in personal income. In the past, retroactive payments large enough to have a measurable impact on the personal income figure occurred fairly infrequently. Now, however, so long as there is any lag in the Pay Board approval process, there will be a continuing flow of retroactive payments. Although no single one of them is likely to be large enough to have a discernible effect, their collective impact is large enough to warrant notice.

BEA has estimated that retroactive wage and salary payments in the first quarter amounted to about \$2½ billion at an annual rate, concentrated in February. Some of this pay was earned in the first quarter, some in the fourth, some in the third, and some even earlier. The January personal income figure has been revised up \$0.8 billion (annual rate), all of which represents the estimated amount of retroactive salary payments (mainly to teachers). The February income figure has been revised up \$4.9 billion, the bulk of which is the estimated amount of retroactive payments that month. Retroactive payments in March are estimated to have been about \$2.5 billion.

Table 1 shows month-to-month changes in personal income and its components from last October through

March. The second line in the table shows personal income gross of social insurance contributions, which are deducted from the sum of the income components to arrive at personal income as defined in the national accounts.

National income

The wage and salary component of personal income is calculated on a cash, or receipts, basis. Therefore, retroactive wage payments are included in personal income when paid. However, national income—the aggregate earnings of labor and property arising from current production—is calculated on an accrual basis. For inclusion in national income, wages and salaries should be measured when earned, not when paid.

Some information has been acquired from the Pay Board on the amount of first quarter wage and salary accruals involved in Board approvals. The amount is currently estimated at about \$¼ billion (annual rate) but the figure will increase as the result of future Board approvals of contracts covering part or all of the first quarter. The current estimate has been included in the wage and salary component of first quarter national income. For the present, the fourth quarter national income figures have not been revised even though it is clear that fourth quarter wages and salaries are too low by the amount of earnings approved retroactively. The available information is not complete enough to warrant opening the fourth quarter figures at this time to a revision outside BEA's usual revision schedule.

Inventories

Inventory investment did not contribute importantly to demand expansion last year, and it continued weak in the opening quarter of this year. The preliminary first quarter estimate, based on incomplete data, shows that inventory investment exerted a modest drag on the expansion of GNP as the aggregate accumulation rate slowed from \$2½ billion in the fourth quarter to \$½ billion in the first. Auto and steel inventories continued to decline in the first quarter but the decumulation was at a much slower rate than in the second half of 1971. Offsetting this improvement was a sharp drop in the rate of accumulation of other inventories, following a large increase in this accumulation rate in the fourth quarter.

The recent behavior of inventory investment is puzzling. It is possible that the low accumulation is involuntary, i.e., that businessmen simply underestimated the strength of demand. On the other hand, the recent acceleration of final sales has not taxed capacity, credit is readily available and relatively inexpensive, and business optimism has apparently been on the rise. Though the reasons for the low rate of accumulation are not clear, it does seem likely that the near future will see inventory investment

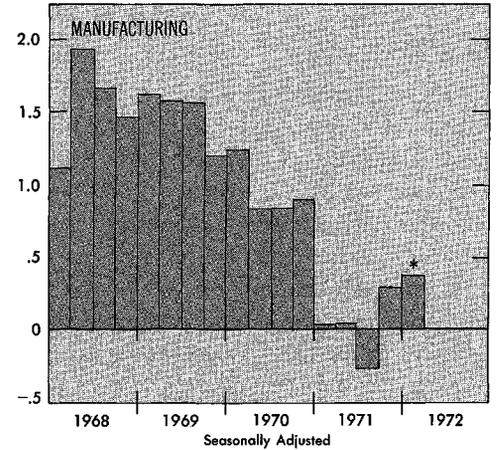

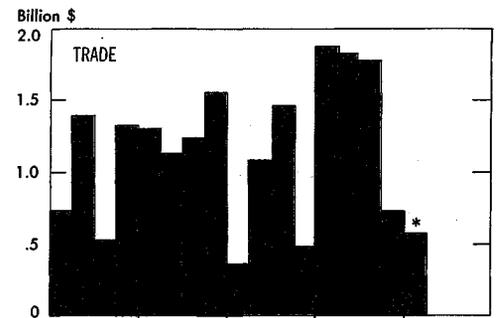

making a much more important contribution to demand expansion.

Manufacturing and trade inventories

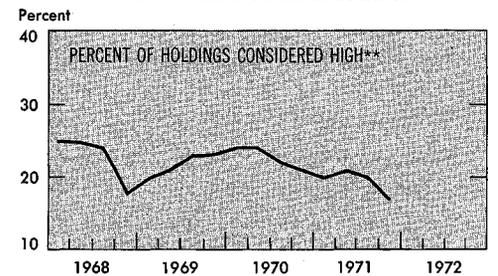

The book value of manufacturing and trade inventories increased at a quarterly rate of \$900 million in January and February, about the same low rate as in the fourth quarter. (Accumulation by manufacturing and trade firms as measured by book value is generally not identical to the inventory investment component of GNP. The latter has broader industrial coverage, but includes only those changes in the value of stocks associated with physical changes in inventory holdings.) Accumulation by trade firms slowed somewhat further in the opening months of this year mainly because of continued liquidation of durables inventories. However, aggregate accumulation by manufacturers increased slightly, as a fairly sizable addition to durables stocks more than offset a decline in the holdings of nondurables producers. The increase in stocks of durables manufacturers was the first in more than a year; it was widespread among the major industry groups, but strongest for the steel mills, defense contractors, and producers of motor vehicles and parts.

1. Data through January and February expressed at a quarterly rate.

Source: Bureau of Economic Analysis and Bureau of the Census.

Trade firms

Wholesalers and retailers added to inventories at a quarterly rate of less than \$600 million in January and February, the weakest showing since the fourth quarter of 1970 when accumulation was depressed by the auto strike (chart 4). The January-February period saw a sizable decline in auto retailers' stocks, though the decline was considerably smaller than that in the fourth quarter when stocks ran off sharply in the face of unusually strong sales growth (table 2). The January-February decline in auto dealers' stocks was more than enough to offset small in-

creases in stocks of other durable goods trade firms.

Trade firms' inventories of nondurable goods increased fairly strongly in January-February. The overall rate of accumulation was roughly in line with that of the fourth quarter but there was an acceleration at the retail level, centered in the general merchandise group, and a slowdown at the wholesale level. Inventory accumulation by wholesalers (in durables as well as nondurables) was swelled in the fourth quarter by the effects of dock strikes.

Manufacturers

Manufacturing firms accumulated inventories at a quarterly rate of \$370 million in January and February (table 3). Though quite sluggish by historical standards, this was the largest increase in more than a year. All of the increase was in durable goods inventories; inventories of nondurable declined \$200 million (quarterly rate) following a surge in the fourth quarter.

Accumulation by durables manufacturers was at a rate of \$575 million in January-February, a marked turnaround from the decline of \$320 million in the fourth quarter. Their accumulation slowed very sharply in 1970, and in 1971 there was decumulation—at an accelerating pace as the year progressed. The year's decline amounted to \$900 million and was the first full-year liquidation since the 1958 recession.

The recent reversal in durables inventories in large part reflects a swing to accumulation on the part of steel

mills (table 3). Mill stocks were cut sharply in the second quarter of last year as producers met heavy demands associated with strike-hedge stockpiling; stocks were little changed in the second half of the year when users were running down excess holdings. Strike-hedge distortions have now run their course, and an increased flow of new orders has resulted in a sizable buildup of mill stocks. Last year's strike-hedge stockpiling also had an identifiable impact on the behavior of inventories held by manufacturers of fabricated metal products; accumulation was strong in the first half of the year and decumulation strong in the second half. The strike-hedging distortion in metal fabricators' inventories also appears now to have run its course.

Accumulation by major defense contractors also contributed importantly to recent strengthening in durables inventories. Inventories in defense industries—ordnance, communications equipment, aircraft, and shipbuilding—declined very sharply during 1970 and most of 1971. Decumulation slowed noticeably after mid-1971, and in the closing months of last year and opening months of this year defense contractors were engaged in fairly substantial accumulation.

Motor vehicle producers, whose inventories declined last year, and producers of instruments, whose inventories showed no change in 1971, also contributed to the recent strengthening of durables accumulation. However, inventories of nonferrous metals producers, the machinery industries, and

the "all other" durables group declined. Within the machinery group, decumulation by nonelectrical equipment producers more than offset some small accumulation in electrical machinery.

In terms of stage of fabrication, the bulk of the first quarter increase in manufacturers' inventories was in work in process; stocks of finished goods rose slightly, while stocks of materials and supplies declined. Given the widespread strengthening since mid-1971 in the flow of new orders for durable goods, and given the lag between the receipt of orders and shipment of finished goods, it is not surprising that the accumulation of durables stocks took the form of work in process. Furthermore, any near term acceleration of inventory investment by manufacturers will probably be concentrated in the work in process and the materials and supplies categories; only a moderate buildup of finished goods stocks should be expected. Stocks of finished goods have increased very little in the past half year or so, following a rather steep decline in the previous six months, suggesting that an excess of finished goods inventories has been corrected.

Inventory condition

The quarterly survey taken in February by BEA found durable goods producers reporting sharp improvement in inventory condition. The findings, which were reported in the March *Survey*, indicated that producers holding 17 percent of manufacturing inven-

tories evaluated their stocks as "high" at the close of 1971 (chart 4). This compares with a "high" ratio of 20 percent in the first three quarters of last year and an average 23 percent in 1970. The sharp improvement in inventory condition was in durable goods manufacturing, where the "high" ratio fell to 18 percent at yearend after holding in the 23-24 percent range in the first three quarters of last year. The yearend proportion was the lowest since early 1966; the recent peak was 28 percent in June 1970. For the non-durables group, the "high" ratio was 15 percent through most of last year, down from an average 17 percent in 1970.

Inventory-sales ratios

The February survey also found manufacturers expecting strong sales growth and sizable inventory additions in the first half of this year. Sales projections, however, are considerably stronger than expected additions to inventories, and if these expectations are realized, the already low manufacturers' inventory-sales ratio will drop even further by midyear.

The inventory-sales ratio for manufacturing and trade firms combined rose rapidly during 1970 but declined steadily in 1971; early this year it stood at the lowest level since the summer of 1966. Manufacturing and trade firms usually have little difficulty maintaining good balance between inventories and sales of nondurable goods,

and inventory imbalance typically centers in durable goods. The inventory-sales ratio for durable goods wholesalers has come down considerably from the highs of late 1970 and early 1971, but is still a little on the high side relative to the ratios that prevailed during most of 1969 (table 4). At the retail level, the ratio for the auto group fell sharply during the sales surge late last year and increased only moderately in the opening months of this year. Auto inventories appear to be in fairly good balance with sales. The inventory-sales ratio for other durable goods rose rapidly from mid-1969 through 1970 but declined sharply in 1971, particularly after midyear, and is currently the lowest in more than six years.

Manufacturing inventory-sales ratios are the lowest they have been since mid-1966. Inventory liquidation last

year resulted in a pronounced and broadly based decline in ratio for durables producers, while the ratio for nondurables has come down moderately from the 1970 level (table 5). Steel producers' current ratio is well below the high of last summer and is about in line with the average for 1970, though above the average for 1969. The recent inventory cuts by nonferrous metals producers have pushed their ratio well below the 1970-71 figures and even below the average in 1969. The ratio for the machinery group has declined steadily since the second half of 1970 as a result of the steep inventory liquidation that continued into the early months of this year. Ratios are also quite low for the motor vehicles and parts industries and the "all other" durables group.

In the defense products industry, the inventory-sales ratio has been rising

fairly sharply since last spring. This reflects the swing to fairly sizable inventory accumulation and a decline in sales. The ratios for producers of fabri-

cated metal products and instruments and related products have shown little change in the recent past and appear about in line with 1970-71 figures.

Recent Developments in Labor Markets

Further strengthening in the demand for labor was evident in the opening quarter of this year, according to the two major indicators of aggregate employment, the nonfarm payroll series and the household survey. The average number of employees on nonfarm payrolls surged 730,000 (seasonally adjusted) from the fourth quarter to the first, to a new high of 71.8 million. That increase was the largest since early 1969 and followed a gain of 387,000 in the fourth quarter and a small decline in the third (table 6).

By far the largest part of the first quarter employment gain was in "service-producing" industries, where employment rose a record 570,000. Increases were very large for State and local governments, where federally-

aided public service jobs contributed to the gains, for retail trade, and for the miscellaneous services group. The rise in service industry employment also reflected the return to payrolls of West Coast longshoremen and New York telephone workers who had been on strike.

Employment in the goods-producing industries rose 155,000 from the fourth quarter to the first, with most of the

(Continued on page 48)

Input-Output Transactions: 1966

As part of its continuing program of input-output work, the Bureau of Economic Analysis has updated the 1963 input-output table to 1966. The updated table is at the 85-industry level, as was the summary version of the 1963 table that was published in the November 1969 SURVEY.

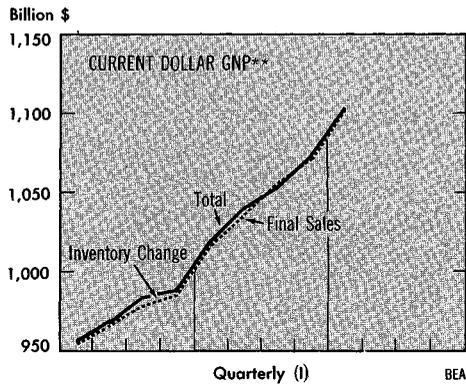

The 1966 input-output table incorporates a mixture of actual 1966 data and a summary updating of the relationships in the 1963 table. The total output of each industry and the final market purchases are based directly on 1966 statistics, while the intermediate inputs reflect primarily 1963 relationships. These relationships have, however, been modified to incorporate changes from 1963 to 1966 in the relative prices of the inputs and in the average use of a product resulting from changes in technology, scale of operation, product mix, and other factors. The allowances for changes in relative prices involve a much more detailed repricing of inputs than that contained in updated tables prepared by others.

The 1966 updating has been published in BEA Staff Paper in Economics and Statistics, No. 19. The Staff Paper contains the interindustry transactions table, the table of direct requirements per dollar of output, and the table of total requirements per dollar of delivery to final demand. Two other tables are included. One compares actual 1966 industry outputs with 1966 outputs calculated by applying the 1963 total requirements table to 1966 actual sales to final markets; the other shows total output (divided into direct and indirect) attributable to each category of final demand. The Staff Paper also contains a brief summary of the methodology used for the updating.

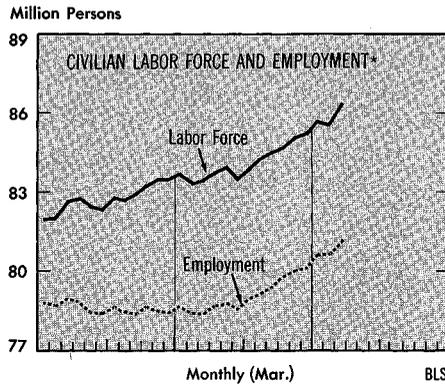

Copies of the Staff Paper are available on request so long as the supply lasts. Because the supply is limited, no request for more than three copies can be accepted. Address requests to Interindustry Economics Division (BE-51), Bureau of Economic Analysis, U.S. Department of Commerce, Washington, D.C. 20230.

- In first quarter: GNP rose about \$30¼ billion; real output increased at an annual rate of 5¼ percent
- In March: The unemployment rate edged up to 5.9 percent; nonfarm payroll employment increased 275,000
- Decline in wholesale farm and food prices offset rise in industrial prices

HISTORICAL STATISTICS

National income and product data for 1929-63 are in *The National Income and Product Accounts of the United States, 1929-1965, Statistical Tables* (available at \$1 from Commerce Department Field Offices or the Superintendent of Documents; see addresses inside front cover). Each July SURVEY contains preliminary data for the latest 2 years and final data for the preceding 2. The July 1971 issue has data for 1967-70. Prior July issues have final data as follows: 1964-65, July 1968; 1965-66, July 1969; 1966-67, July 1970. BEA will provide on request a reprint of final data for the years 1964-67.

Wages and Salaries

Wages and salaries as measured in personal income are on a cash or receipts basis, and the figures for first quarter 1972 incorporate disbursements of pay increases approved retroactively by the Pay Board. Wages and salaries are measured in national income on an accrual basis and the first quarter 1972 figures include estimates of the amount of the retroactive pay earned in the quarter. The 1971 figures for wages and salaries in national income have not yet been revised to incorporate the accrual of the earnings paid retroactively in 1972.

¹ Preliminary.

1. Excludes gross product originating in the rest of the world.

2. This is equal to the deflator for gross product of nonfinancial corporations, with the decimal point shifted two places to the left.

3. Personal saving as a percentage of disposable personal income.

Total and Per Capita Personal Income, 1971

TOTAL personal income in the Nation rose 6¼ percent last year, with gains of 5¼ percent or more in each of the eight regions and at least 4¼ percent, in all but one of the States. Nationally, consumer prices rose a little more than 4 percent. The personal income gain in all regions and in 49 States and the District of Columbia exceeded the increase in consumer prices so

that the real purchasing power of consumers apparently increased at least moderately. The one exception was the State of Washington, where income rose 4¼ percent, about the same as the rise in consumer prices. (Of course, there were areas *within* States where income changes were so small that real incomes failed to rise.)

On a per capita basis, the largest gains in current dollar personal income—ranging from 8 to 13 percent—were in North Dakota, the District of Columbia, South Dakota, Arkansas, New Mexico, and Arizona. For the Nation as a whole, per capita personal income was up 5½ percent from 1970 to 1971. In 44 States and the District of Columbia, per capita income rose at least as much as national consumer prices. In Minnesota, New Hampshire, Connecticut, Alaska, Washington, and Montana, however, the gains in per capita income were at best about equal to the advance in consumer prices.

ance, and real estate group, and the transportation, communications, and public utilities group. In the Southeast, there were large gains in farming, mining, and manufacturing, and sizable advances in many service-type activities. In the Southwest, there were also large gains in mining and in local service-type industries.

Income increases were equal or close to the 6¼ percent national average in the Plains (6¼ percent), Great Lakes (6½ percent), Far West (6½ percent), and Mideast (6¼ percent). The gains in all four regions were fairly evenly spread among major income components, but there were particularly strong increases in farming in the Plains and in manufacturing in the Great Lakes.

New England's income increased 5½ percent in 1971—the only regional gain which was well below the national average. Manufacturing wage and salary payments and income from farming declined, and income from most service-type activities went up less than in the Nation as a whole.

Table 3 shows for each State and region the percent change from 1970 to 1971 in total personal income and in earnings from major industries.

State patterns

The States with the largest 1970-71 personal income gains, ranging from 9 to 14 percent, were North Dakota, Arizona, Arkansas, New Mexico, South Dakota, Nevada, Colorado, Tennessee, Utah, South Carolina, and Kentucky. In these 11 States, increases in earnings from most industries tended to be well above the national average. Manufacturing earnings increased at least 4¾ percent in each of these States, compared with a national advance of 2

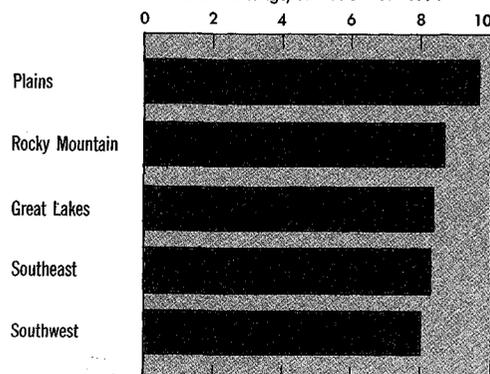

CHART 9

Regional Personal Income

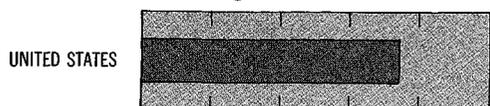

Income Has Advanced in All Regions Since the Trough of the Recession in Late 1970

• Regions with gains above the national average

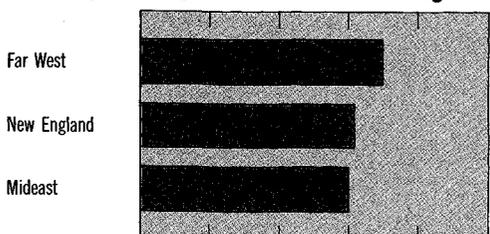

Percent Change, IV-1970 - IV-1971

• United States average

• Regions with gains below the national average

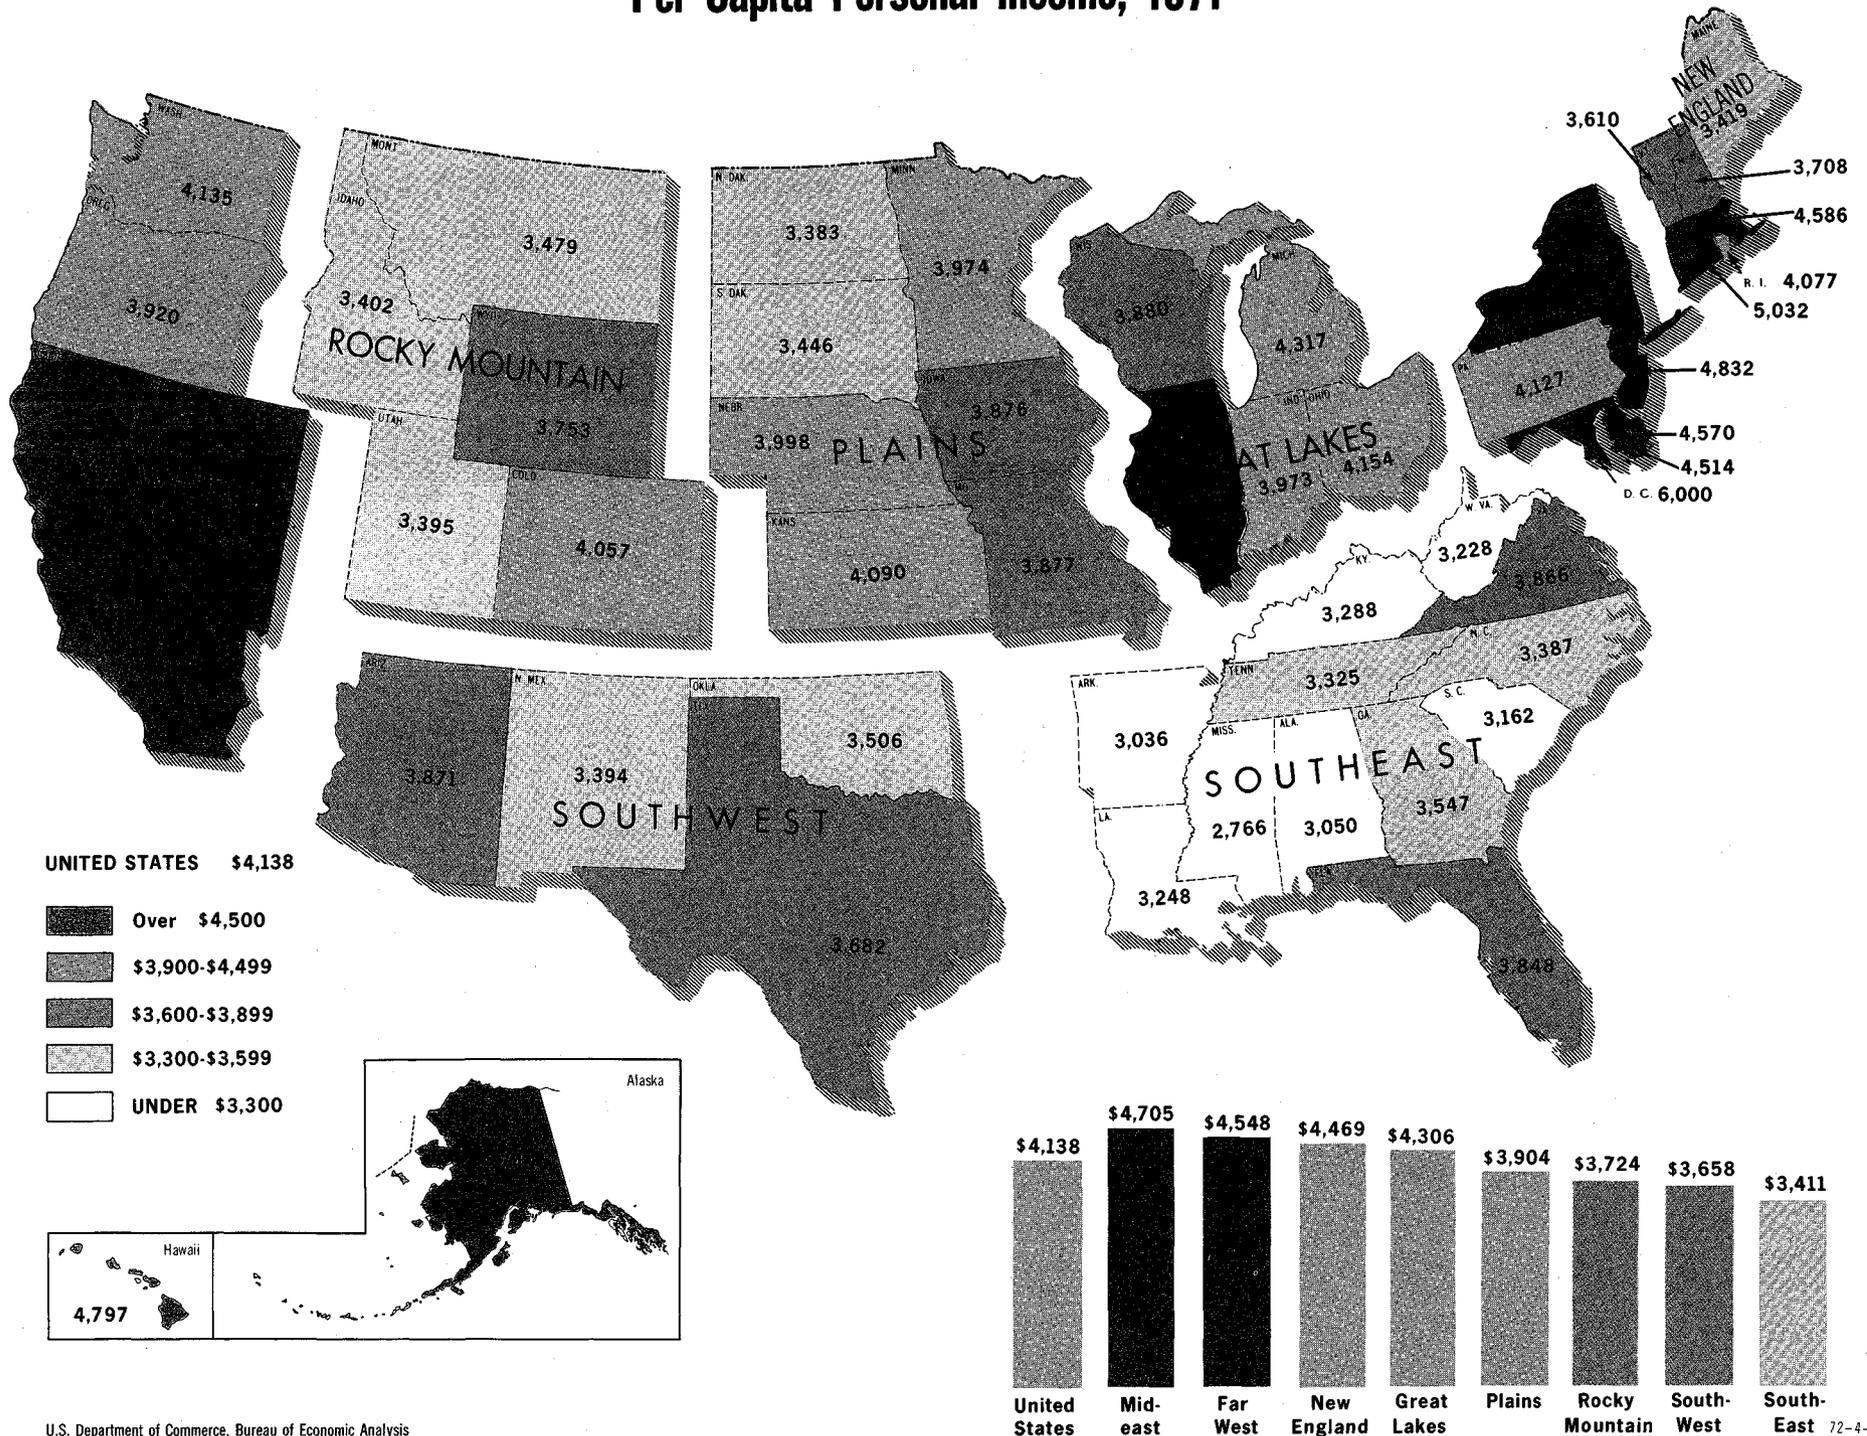

1970-71 Change in Total Personal Income

The regions with the largest gains last year in personal income were the Rocky Mountain (8½ percent), Southeast (8¼ percent), and Southwest (7¼ percent). All three regions had very large gains in construction and Federal civilian payrolls. The Rocky Mountain region also had gains in manufacturing payrolls that were above national average, and the strength in these basic industries led to large advances in a variety of local service industries, including wholesale and retail trade, the finance, insur-

NOTE.—The estimates of State personal income were prepared in the Regional Economics Division by Q. Francis Dallavalle, Gordon Lester, Jr., and Steven Johnson.

Per Capita Personal Income, 1971

72-4-10

percent. Among other basic industries, the gains in farm income were well above the national average in eight of the 11 States and the gains in Federal payrolls were well above average in seven of the States. Construction payrolls increased more than the national average of 5 percent in all 11 States, and there were gains of 15 percent or more in six States. Reflecting these advances, most of these 11 States had gains well above average in the finance, insurance, and real estate group, in the transportation, communications, and public utilities group, wholesale and retail trade, and services. Personal income in the District of Columbia was up by more than 9¼ percent last year, largely because of an advance of more than 10 percent in Federal civilian payrolls.

At the other end of the scale, last year's income advance was relatively weak—ranging from 4¼ to 6 percent—in Maine, New York, Pennsylvania, Minnesota, Ohio, Rhode Island, Montana, Connecticut, and Washington. Farm income was off in seven of the nine States, and manufacturing payrolls were weak—off moderately or up only a little—in eight. Declines in manufacturing payrolls played the key role in the weakness of overall income in Washington, Connecticut, and Minnesota, while the very small size of manufacturing gains limited the overall income gain in Pennsylvania and New York.

Income Change, Fourth Quarter 1970 to Fourth Quarter 1971

A clear picture of the 1971 economic recovery and advance can be seen in the regional and State income changes from the fourth quarter of 1970 (the cyclical low point) to the fourth quarter of 1971; the latter is the most recent quarter for which State income estimates are available. In addition to the economy's recovery from the recession low, factors influencing regional income developments over this four-quarter span included: (1) recovery from the auto strike of late 1970; (2) a sharp rise in farm income reflecting an increase in farm prices and a much larger

volume of marketings, particularly from the bumper crops of corn and grain sorghums; (3) a small decline in mining payrolls because of the strikes in the coal industry during the fourth quarter of 1971.

As chart 9 shows, from the fourth quarter of 1970 to the fourth quarter of 1971, income in the United States rose 7½ percent. Gains well above the national average were scored in the Plains (9¼ percent), Rocky Mountain

(8¾ percent), Great Lakes (8½ percent), and Southeast (8¼ percent). Farm income increased in all four regions—sharply in the Plains, Southeast, and Great Lakes, and more moderately in the Rocky Mountain region. Reflecting both the rebound from the auto strike and the general economic recovery, manufacturing payrolls rose more than 10 percent in the Great Lakes, a gain twice the national average. The Southeast had a large gain in total personal income even though mining payrolls were off sharply. There was a large advance in the region's farm income and above-average gains in Government payrolls—an important income source in the region—and in a wide variety of local service industries.

Gains in the Southwest (8 percent) and Far West (7 percent) were fairly close to the national average advance. Income gains in New England (6¼ percent) and the Mideast (6 percent) were well below average. In the latter two regions, manufacturing and construction payrolls showed only small increases and advances in many service-type industries were well below the national average.

In 10 of the 11 States with the largest income gains, ranging from 10 to 20 percent, there were very big increases in farm income; in the 11th—Michigan—the key was the sharp recovery in manufacturing payrolls following the auto strike and their further advance during the year. (see table 1.) At the other end of the scale, income rose by 6 percent or less in six States. In all six, manufacturing payrolls either rose little or declined somewhat. The smallest advance was in West Virginia (1¼ percent), reflecting a sharp drop in mining payrolls because of the coal strikes.

Mining payrolls declined also in Virginia, Pennsylvania, and Kentucky, apparently because of the coal strikes, but other income components increased sufficiently to offset the loss from mining, and personal income in all three States advanced at a pace close to the national average.

Percent changes in personal income in each region and State from the fourth quarter of 1970 to the fourth quarter of 1971 are shown in the last column of table 2.

State Projections of Income, Employment, and Population

The State projections presented here are one product of a joint program undertaken in 1964 by the Bureau of Economic Analysis of the Department of Commerce and the Economic Research Service of the Department of Agriculture to provide economic data for use in water resources development planning. The program was initiated at the request of the Water Resources Council and in large part funded by the U.S. Army Corps of Engineers, the Bureau of Reclamation, and the (then) Federal Water Quality Control Administration. Later this year, the Water Resources Council will publish a five-volume set of economic projections covering 173 economic areas, 206 water resources planning areas, and the 50 States.

The projections were prepared in the Service Branch, Regional Economics Division of BEA by Lyle Spatz, Steven Tzanef, Eleanor Curry, and Tasia Anton under the general supervision of Henry DeGraff, Chief of the Service Branch, and under the direct supervision of Edward A. Trott, Jr. Lowell Ashby, Assistant Chief of the Division, was responsible for the projections of the national aggregates which formed control totals for the geographic disaggregations. Computer programming was done by David Cartwright and Evelyn Richardson. Many others in the Division played an integral role by furnishing the economic measures requisite to the projections and by developing certain of the analytical techniques used.

BEA wishes to acknowledge the assistance of the Economic Research Service, which prepared the agricultural income and employment components of the State projections.

The State estimates of total and per capita personal income in this report differ from the State series regularly published in the August issue of the SURVEY on two counts.

First, these estimates are expressed in dollars of constant (1967) purchasing power, whereas the regular State income series is expressed in current dollars.

Second, as with the regular State income series, the data in this report reflect the State of residence of the population and of income recipients and employees, but there is one major exception: the earnings data in table 6 reflect the State in which earnings recipients work. The earnings data are presented on a where-worked basis because in water resources planning this is the preferred concept. Also, data with which to adjust earnings in each industry from a place-of-work to a place-of-residence basis are not available. Such an adjustment has been made for total income, however.

The Bureau of the Census published "Preliminary Projections of the Population of States: 1975 to 1990" in March 1972 as *Current Population Reports, Series P-26, No. 477*. Those projections are based on various assumptions about future patterns in the components of population change (fertility, mortality, interstate migration, and net immigration from abroad). The assumptions are entirely demographic; no specific assumptions were made about economic factors which could influence future trends in the demographic components of population change. In the projections presented here, the emphasis is on economic projections, mainly personal income, and the population projections are essentially a by-product of the income and employment projections. In general, the State population projections presented here are reasonably close to those of the Census Bureau.

THIS article presents projections of personal income, employment, and population, by States, for 1980 and 1990. These projections, as with all efforts to look into the economic future, are based upon an extension of past relationships. The methodology used for these projections has four characteristics which distinguish the results from those of a simple linear extension of trends at a summary level.

First, the basic projections were made for 173 economic areas into which BEA has divided the country, using criteria that make the areas especially suitable for economic projection and analysis. The projections for areas that cross State lines were disaggregated into the State segments required for reaggregation to State totals.

Second, the economic area projections were made within the framework of projections of the overall U.S. economy. Projections of population, employment, and income were made first for the Nation, then disaggregated geographically.

Third, the projections are based on the assumption that people migrate to areas of economic opportunity and away from declining areas. Accordingly, projections of area income and employment were prepared first, and projections of area population derived from them.

Fourth, projections of income and employment were prepared for each of as many as 39 industries in each of the

173 areas. Various methods were used to make the projections, depending upon the individual industry's role in the area's economy. However, the methods used insure that in each of the 173 areas the industrial composition of projected income and employment constitutes an economy with an internally balanced structure. The fact that the projections were prepared in industrial detail makes it possible for the projected economic path of an area to depart substantially from past trends.

Nature of the projections

These projections are intended to be a best estimate of what can be expected if there are no policy or program changes of unusual nature or magnitude, such as the establishment of a large number of "new towns". The projections are neither a goal for nor a limit upon any given region's future economic activity. They carry no connotation of desirability or undesirability.

Projections of this type can be useful in the assessment of future public and private demands for goods and services. These include, for instance, demands for physical capital related to energy and water resources development and pollution abatement, as well as needs for teachers, policemen, doctors, and workers in other public and private service capacities.

The projections also permit developing problems such as excessively slow growth or low per capita incomes to be foreseen, so that corrective policies can be adopted.

Furthermore, the projections can provide a framework for program evaluation purposes. If a remedial or developmental program is considered for an area, the projected economic activity in the area can be modified to reflect the expected effects of that program. Comparison of the modified projections with the baseline projections provides a quantitative measure of the effects of the program, positive or negative, in each region affected.

The first part of this article summarizes past and projected changes in State income, employment, and popula-

tion. Following that, there is a description of the concepts and methods used in making the projections.

Changes in Total Personal Income

Personal income in the Nation (expressed in 1967 dollars) is projected to increase from \$690 billion in 1969 to \$1,663 billion in 1990, a rise of 141 percent. State percentage increases range from a low of 93 percent in South Dakota to a high of 213 percent in Nevada, with the increase in 25 States falling within 10 percentage points of the national average.

The largest absolute increases are projected in California and New York. In New York, the large size of the increase—\$94 billion—is mainly a function of the present size of that State's economy, for the projected percentage increase is only 125 percent, compared to 141 percent nationally. California's projected increase of \$123 billion reflects not only the large present size of the California economy but also a projected growth of 159 percent—fifth largest in the Nation.

Other large gains, ranging from \$46

billion to \$56 billion, are projected in Michigan, Pennsylvania, Ohio, Illinois, and Texas. The size of these gains is mainly a reflection of the size of the economies of these States. At the other end of the scale are increases ranging from \$1 billion to \$2 billion in Vermont, North Dakota, South Dakota, and Wyoming. The smallness of these advances mainly reflects the smallness of the States' economies, although there is also the factor that projected growth rates are below average except in Vermont.

From 1929 to 1969, there was a pronounced shift in the distribution of personal income from the northern and central areas of the country to the south and west. In 1929, the residents of the New England, Mideast, Great Lakes, and Plains regions together received 73 percent of the Nation's total income; in 1969, their share was 59 percent. The Southeast, Southwest, Rocky Mountain, and Far West regions received 27 percent in 1929 and 41 percent in 1969.

The summary data in table 1 show that the shift was milder in the 1950-69 span than in 1929-50, and that a further moderation is projected for 1969-90. The table shows each region's

1. Alaska and Hawaii included in southern and western total.

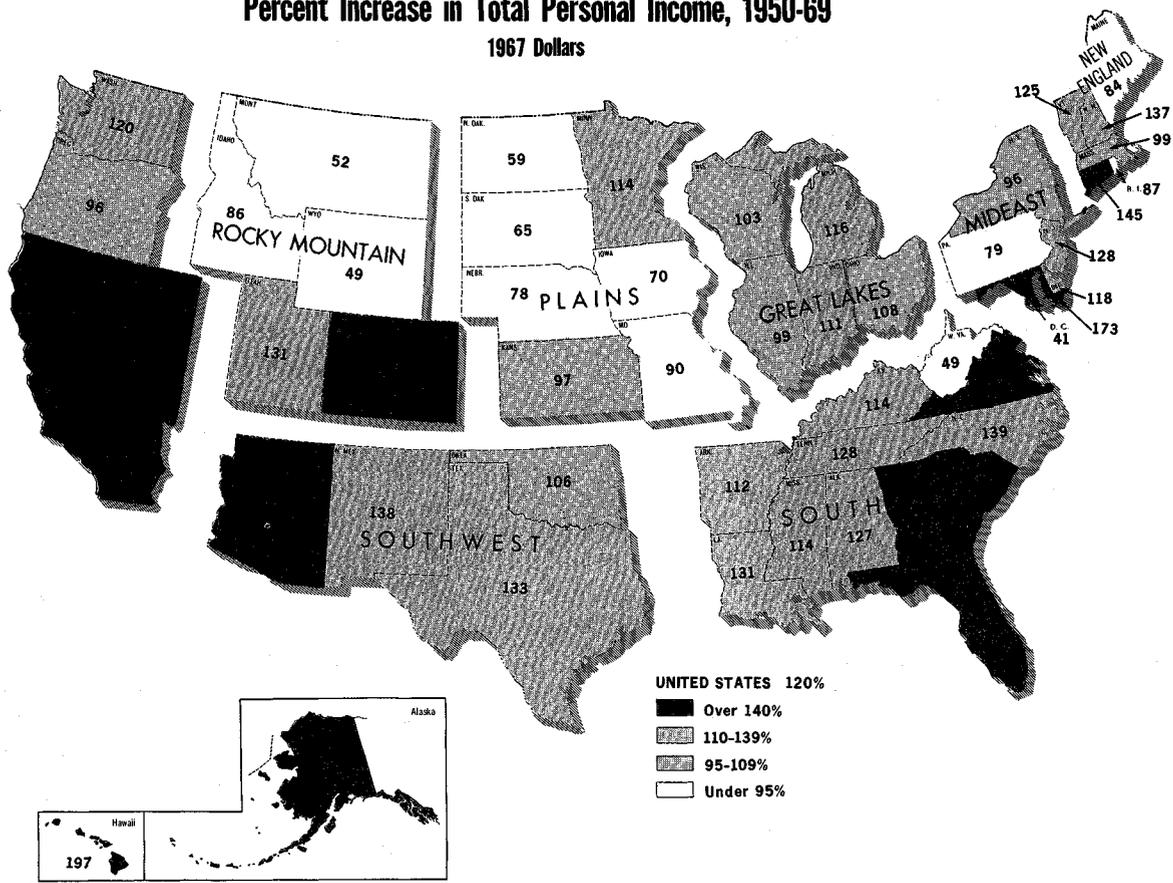

2. Percent changes calculated from data carried to one more decimal than shown.

3. Alaska and Hawaii are excluded from 1929 data. To achieve comparability, they were excluded from 1950 data in calculating percent change for 1929-50 period.

CHART 11

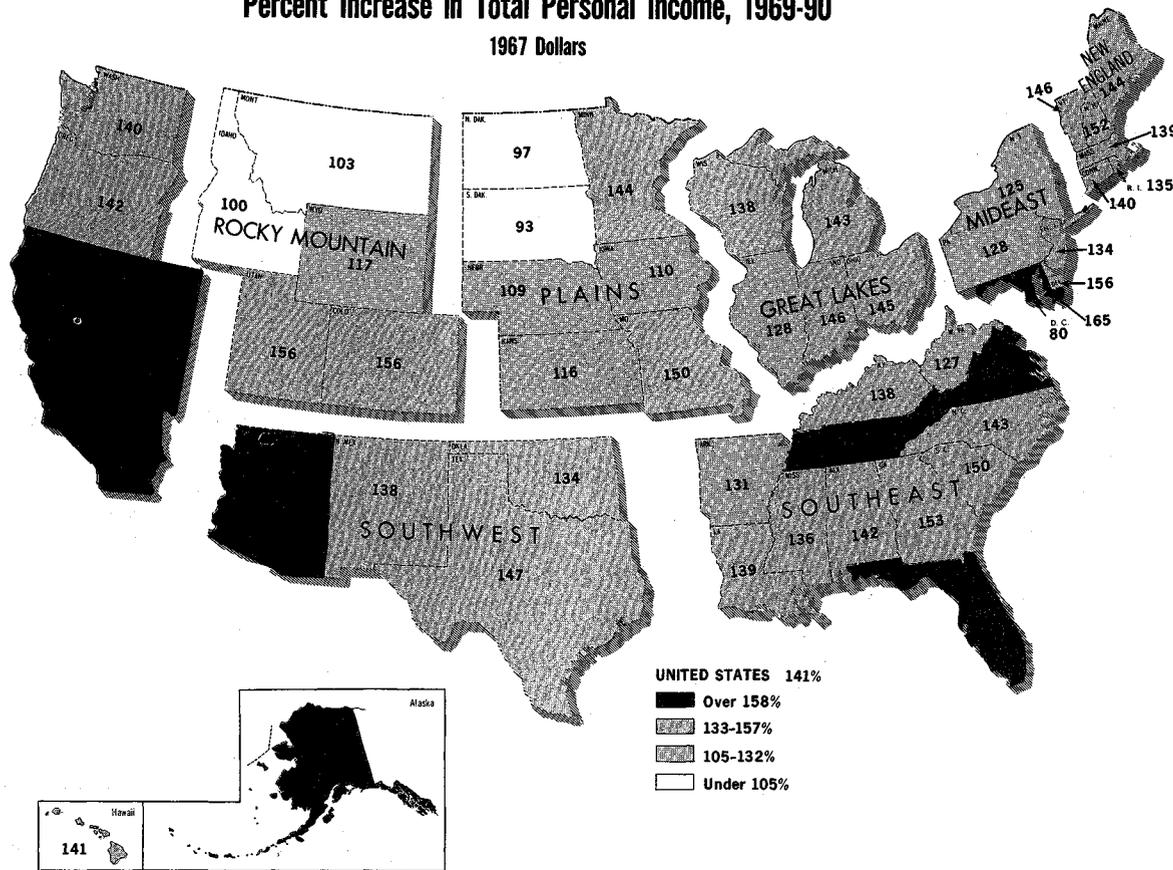

Percent Increase in Total Personal Income, 1950-69

1967 Dollars

Percent Increase in Total Personal Income, 1969-90

1967 Dollars

share in the Nation's personal income in 1929, 1950, 1969, and 1990, and the percentage changes in these shares. The size of the percentage change in a region's share reflects the size of the gap between the growth rate of income in the region and the growth rate in the Nation as a whole.

Historical income changes

The 1929–50 shifts in the geographic income distribution which are shown by States and regions in table 3, reflect several principal factors: the growth of the western areas of the country in their role as economic frontiers; the absorption into the main-stream economy of much of the historically underused labor force of the Southeast, especially under the impetus of the demand caused by World War II; the establishment of many military installations and their associated civilian activities in the south and west during the 1940's; the many State efforts at industrial development which resulted in increased industrialization through much of the south; and the large increase in agricultural income during the 1940's.

The slowing of the shift in the 1950–69 period also reflects a variety of factors. Federal Government payrolls—military and civilian—which had played so prominent a role in the economic growth of the south and west during World War II grew at a rate only slightly above average over the next two decades. In contrast, State and local government and service payrolls surged ahead in a "catchup" phase. Because the geographic distribution of the latter is much more in proportion to overall economic activity than is the distribution of Federal payrolls, their effect on income growth in 1950–69 was comparatively uniform across the Nation.

Agricultural income, which had risen sharply during the 1940's under the pressure of increased domestic and foreign demand, declined during the 1950's and rose only a little during the 1960's. This sluggish performance signif-

icantly slowed income growth in the south and west.

Income from textile manufacturing, which is of major importance in the income structure of the Southeast, declined during the 1950's and registered a rate of increase during the 1960's less than that of other industries. This limited income growth in the Southeast.

The slowing of the income shift to the south and west, as a result of the factors cited above, was mirrored in a slowing of the shift away from the north and east. Another relevant factor is that New England's share of the Nation's income dropped sharply during the 1940's but only slightly during the 1950's and 1960's as its economy shifted away from textiles and leather and into faster-growing nonautomotive transportation equipment, research and development, and educational activities. Also, as the national economy experienced the inflationary pressures of the latter part of the 1960's, the economic resources of all regions were used at near-capacity rates and this tended to diminish differences in regional growth rates.

Two exceptions may be noted to the historical pattern of deceleration in rates of change of regional income shares. The Plains' share showed a slight percentage decline in the 1930's and 1940's but the largest decline of any region in 1950–69. In the Rocky Mountains, a sizable increase in the 1930's and 1940's was followed by a moderate decline in 1950–69. In both regions, overall income growth was relatively slow in the 1950–69 period, reflecting the decline of agricultural income from its highs of the late 1940's and early 1950's.

Projections: regions with rising shares

The projections, shown in summary in table 1 and in detail in table 6, indicate that the Far West, Southeast, and Southwest will continue to increase their shares of the Nation's personal income.

However, as shown in table 1, their shares will grow at rates only about one-third as fast as in the 1950–69 period. An important factor in this slowdown is that Federal payrolls are about twice as important in these three regions as in other areas and contributed greatly to the above-average income growth of these regions in the past; but are projected to be a slow-growth income source in the 1969–90 period. Military strength is held constant for the projections and military payrolls increase only as average military pay increases. Also, Federal civilian employment and payrolls rise at about the same rate as other types of employment and income.

Farm income, though greatly diminished as an income source throughout the Nation, is still nearly twice as important in the Southeast and Southwest as in the rest of the country. Because of this, the relatively slow growth projected for farm income over the next 20 years—only two-thirds as fast as income from nonfarm industries—is another factor tending to dampen projected income growth in these two regions.

Nevertheless, income in the Southeast, Southwest, and Far West is projected to grow faster than the national average in 1969–90. This is largely because of continued rapid growth in manufacturing in most States of these regions (table 6). In the two southern regions a "catchup" expansion in service industries, representing a maturing or upgrading of the economic structure, is an additional factor. Also, in States such as Florida, Arizona, and California, immigration of retired persons is expected to boost personal income. However, because the income of a retired person is generally less than that of a wage earner or self-employed individual, growth of per capita income in "retirement areas" will be dampened.

Six of the 10 States with the largest projected percentage gains in income are in the Southeast, Southwest, or Far West. These are Tennessee, Florida, Virginia, Arizona, California, and Nevada. The other four are Utah and Colorado, in the Rocky Mountain region; Maryland, in the Mideast; and

Alaska, not classified in any region because of its geographic separation from other States.

Projections: regions with declining shares

Over the long run, income growth in the Rocky Mountain region has been above the national average. However, this pattern was reversed during the 1960's as a result of agricultural developments, which dominate the growth rate of income in Montana, Idaho, and Wyoming. The 1969-90 projection puts income growth in the region slightly below the national average, so that the region's share of the Nation's income drops slightly. Income from agriculture in Montana, Idaho, and Wyoming is projected to grow at a much slower pace than income from nonfarm industries.

In Colorado and Utah, however, a number of manufacturing industries are projected to expand at above-average rates, and metropolitan areas are attracting a variety of economic activities that serve areas outside of the two States. As a result, these two States rank ninth and tenth in the Nation in terms of the projected rate of income growth.

The projections show continued downtrends in the share of the Nation's income going to the Mideast, Great Lakes, Plains, and New England regions.

The large, economically mature, Mideast region sustained the largest percentage decline in share in 1929-69 and is projected to experience the second largest decline over the next 20 years. The situation is a reflection of both the age and the economic maturity of the region, and it is not possible to single out one or two industries as responsible. Income from most industries is projected to grow at slightly below-average rates. This is due partly to the shift of certain market-oriented industries—those that tend to locate where the population is concentrated—to faster-growing areas in the south and west. Another factor in the lag of the economy of the Mideast is the development in the newer urban centers of the Nation of many of the financial, wholesale, and

communications services previously performed in the large cities of the Mideast.

Projections for two States of this region, Delaware and Maryland, are counter to the regional trend. Income in these States is projected to rise at above-average rates. This continues the long-term income trend in these two States, whose economic growth patterns tend to be more like those of the States to the south than of those to the north. In both States, manufacturing provides the major stimulus to projected growth.

The Great Lakes region has a large industrial capacity with emphasis on durable goods production. Over time, there has been a gradual shift in the share of durable goods industries away from the Great Lakes. This tends to leave some excess labor and plant capacity in the region which can be drawn rapidly into production. This excess was drawn on during World War II, in the postwar durable goods boom, and again during the Korean and Vietnamese wars, resulting in surges of income in the region that interrupted the secular downtrend. Should such developments occur in the future, they would again interrupt the projected downtrend.

The projected decline in the Plains' share of the Nation's income is solely a reflection of the dominant role of agriculture in that region. The share of agriculture in "export" industry earnings in the Plains is 26 percent, approximately three times its share nationally. "Export" industries, those that sell a large share of their output to other regions, are especially important in the economic growth of a region. With farm income nationally projected to rise only 10 percent between 1969 and 1990, in contrast to a doubling of income from nonfarm "export" industries, income growth in the Plains is obviously limited. The projected 1969-90 decline in the Plains' share of income is much milder than the 1950-69 decline. This reflects the reduced importance of agriculture in the economy of the region. In 1950, agricultural income accounted for more than half of the income from "export" industries in the Plains, in contrast to 26 percent in 1969.

The income growth lag in the Plains is concentrated in Iowa, North and South Dakota, and Nebraska, States where farm income makes up from 38 to 60 percent of "export" industry income.

New England's share of the Nation's income has been declining over the long run, but the shrinkage began to slow as early as 1950, as the region lost much of its textile and leather manufacturing industries. By the 1960's the region's income growth lagged only slightly behind the national rate, and its projected growth from 1969 to 1990 is not significantly different from that of the Nation. Projected growth for the three northern New England States is above average. In Maine and Vermont, the margin is slight; in New Hampshire, it is substantial. New Hampshire's projected gains are concentrated in trade and the services and are due in large measure to the direct and indirect effects of the State's growing recreation-oriented industries.

Employment Projections

Employment projections are shown in table 6. Employment estimates covering the entire Nation at the local area level are not available at this time for years later than 1960. Because of this lack of data, state employment has been projected only on an all-industry basis. Projections of local area employment in industry detail will be made upon completion of a local-area employment series now being prepared by BEA on a place-of-work basis. Meanwhile, the industry earnings components of personal income can serve, at least in limited degree, most uses for which industry employment figures are desired.

In general, projected changes in total employment by State are closely correlated with those in total income. Minor differences between the behavior of projected employment and of projected income are caused by the concentration of retired persons, together with their income; in certain areas and because transfer payments and property income expand in some areas at rates that differ from the rate of employment increase.

Population Projections

As described in the section on methodology, changes in area population are projected as a function of changes in area employment, with special adjustments made for "retirement" areas. Because projected employment changes are reconciled with projected changes in earnings of employees, and because earnings form the bulk of personal income, there is a strong correlation between the projected changes in population and those in income.

As with the income projections, the projected population movements are generally in line with past trends. The only significant exceptions are in New England and the Rocky Mountains (table 4).

New England's population is projected to rise at an above-average rate. The region's population growth was below average during the 1940's and 1950's, when the region was falling behind national growth rates in most economic measures. During the 1960's, when economic growth in the region nearly equaled that in the Nation, population growth was only slightly below average. During the 1970's and 1980's the region's population growth is projected to exceed the national rate by a small margin as people are attracted to the above-average economic opportunities of the region.

In the Rocky Mountain States, where population growth was above average from 1929 to 1969, the projections call for growth slightly below average over the next two decades. This stems from

the relatively slow growth projected for agricultural income in Montana, Idaho, and Wyoming. Slow income growth means fewer economic opportunities, which mean less immigration and sometimes even net outmigration of population. Population projections for individual States are shown in tables 4 and 6.

Per Capita Income

In general, regional population and income growth rates both tend to deviate from the national average in the same direction, although the magnitudes of the deviations may differ a good deal (table 1). However, the observed tendency for regional per capita incomes to converge toward the national average means that some divergence does occur between trends in an area's population and in its personal income. The degree of this divergence appears to be correlated with the level of per capita income. Thus, in regions with above-average per capita income, the population growth rate tends to exceed the national average by a wider margin than does the personal income growth rate. In areas with below-average per capita income, population growth relative to the national average is slower than personal income growth relative to the national average. Under both conditions, the per capita income of the region moves toward the national average. The most striking examples of this occur in the Southeast and Far West (table 2).

In the Southeast, personal income growth far outpaced the national average from 1929 to 1969, but population growth was below average (table 1). As a result, per capita income in the region rose from 52 percent of the national average in 1929 to 80 percent of it in 1969 (table 2). In the Far West, by contrast, income growth was well above average from 1929 to 1969 but population growth exceeded the national rate by an even greater margin, and per capita income in the region fell from 129 percent of the national average to 112 percent.

Continued convergence of per capita incomes is projected for 1969-90. This can be seen in summary in table 5 and in detail in table 6.

CONCEPTS AND METHODOLOGY

The projections presented here are based on an extension of past relationships believed to have relevance for the future. The choice of relationships to be extended and the methodology for extending them are based on assumptions, some of which are stated explicitly and some of which are implicit in the projection methodology. The assumed conditions are those believed to have the greatest probability of realization. Thus, the projections represent an attempt, imperfect though it may be, to forecast the economic future.

In general, long range projections are more likely to prove wrong than are those made for short periods, and projections in detail are more likely to prove wrong than those of broad aggregates. Accordingly, projections for 1990 are probably less reliable than those for 1980; projections for a specific industry in a specific region are probably less reliable than those for the same industry nationally; and earnings projections for a specific industry are probably less reliable than those for total earnings or total income. By the same token, a projection of the labor force at the national level for 1990 is probably quite reliable because that labor force will be drawn almost entirely from a population the size and age distribu-

tion of which are known, though projected participation rates may be wrong. However, a projection of the 1990 labor force in a given State is related not only to the current State population but also to future interstate migration, and is therefore much less reliable than the national projection.

Assumptions

The projections are based on longrun or secular trends and ignore the cyclical fluctuations which characterize the shortrun path of the economy. The general assumptions that underlie the projections are as follows:

(1) Growth of population will be conditioned by a decline of fertility rates from those of the 1962-1965 period.

(2) Nationally, reasonably full employment, represented by a 4 percent unemployment rate, will prevail at both of the points for which projections are made; as in the past, unemployment will be disproportionately distributed regionally, but the disproportion will be diminishing.

(3) At projection dates, there will be no direct effects on the projections due to foreign conflicts.

(4) Continued technological progress and capital accumulation will support a growth in private output per man-hour of 3 percent annually.

(5) The new products that will appear will be accommodated within the existing industrial classification system, and, therefore, no new industrial classifications are provided.

(6) Growth in output can be achieved without ecological disaster or serious deterioration, although diversion of resources for pollution control will cause changes in the industrial mix of output.

(7) The composition of personal consumption will continue to change.

The regional projections are based on the following additional assumptions:

(1) The factors that have influenced historical shifts in "export" industry location will continue into the future but the sharpness of the shifts will diminish.

(2) Trends toward area self-sufficiency in local-service industries will continue.

(3) Workers will migrate to areas of economic opportunities and away from slow growth or declining areas.

(4) Regional earnings per worker and income per capita will continue to converge toward the national average.

(5) Regional employment/population ratios will tend to move toward the national ratio.

Projection procedure

The State income and employment projections were made in six major steps.

First, total national population, employment, GNP, personal income, and earnings were projected. Second, the projected national output, employment, and earnings were broken down into industry detail on the basis of projected trends in industry shares of the national totals.

The third step was to allocate the projected industry totals of employment and earnings to the 173 economic areas into which BEA has divided the country. The methodology of this step for each area's "export" industries—those that mainly produce goods and services for export from the area to other areas—was different from the methodology for the area's other industries, i.e., its "residential" industries. Basically, however, earnings and employment in both types of industry were projected by extrapolating past trends. The nonearnings components of personal income were projected for each area by a method similar to that used for residential industry earnings.

The fourth step was to derive area population totals from projected area employment.

The fifth step was necessitated by the fact that many of the 173 BEA economic areas cross State boundaries. In those cases, it was necessary to divide the projected area figures into State segments. Sixth, the area projections were aggregated to State totals.

The projections procedure is by no means entirely mechanical: At various points in the process, it is essential that judgment be brought to bear, both in

estimating the future rate of change in the industrial composition and location of output, and in checking the consistency of the projections. In particular, with employment and earnings projected separately, it is necessary to review for reasonableness the implied industrial and regional patterns of earnings per worker.

The decision to derive regional projections through the disaggregation of national totals instead of through the independent projection of each component in each region is based on the assumption that the larger the economic area, the more adequate and reliable are the available statistical measures and the more reliable are the projections that can be made. This assumption applies also in the decision to derive projections of industrial detail at the national level by first projecting national employment, output, and earnings and then disaggregating into national totals for individual industries. Of course, it should be obvious that the disaggregation approach is also subject to substantial error—as is any procedure for forecasting the economic future.

Gross national product

The initial step in preparing the national projections was the projection of the gross national product. This was done by multiplying projected man-hours worked by projected output per man-hour. The variables which entered the determination of man-hours worked include the working age population, labor force participation rates, general government employment (civilian and military), and hours worked per year per man.

The Bureau of the Census has made several different population projections, with the birthrate assumption the varying element. In light of all the factors that could be ascertained in mid-1969, when the decision was made regarding the projected population to be used, the "C" series was selected. Of the five Census Bureau projected population series, this one has the second fastest growth rate. It assumes a total

fertility rate of 2,787 births per 1,000 women in 1990, which is below the rate of 3,300 in 1962-65, but above the rate of 2,111 per 1,000 which would maintain a constant population, and above the preliminary 1970 rate of 2,472. The "C" series shows national population increasing from 203 million in 1970 to 270 million in 1990, or about 33 percent. The "E" series, which projects lower fertility than the "C" series and for that reason would be the choice of many persons today, is only 4.4 percent lower than the "C" series in 1990.

The working age population, labor force participation, unemployment rate, and hours worked per man per year were each projected separately and the best available expertise was utilized in each case. The population of working age is, of course, a subset of the total population; the labor force was derived by applying age- and sex-specific participation rates developed by the Bureau of Labor Statistics to the working age population. A 4-percent unemployment rate was adopted as representing full employment nationally. Hours worked per man per year in the private economy were projected to decrease by 0.25 percent per year, compared to the post-World War II average decrease of 0.4 percent per year. The slower rate assumes that the "easy" reductions in hours of work have already been made.

Output (real gross product) per man-hour in the private economy increased at a compound annual rate of 3.2 percent from 1950 to 1968. The projection puts productivity growth at a compound annual rate of 3 percent from 1968 to 1990. The projected rate is somewhat lower than the 1950-68 rate to allow for the fact that some part of the productivity growth in 1950-68 was attributable to a massive movement from farm to nonfarm work which cannot be repeated on a similar scale in the future. There is a variety of opinion on the merits of using the 3-percent rate; some forecasters would lower the projected rate still further because of the projected shift in work force distribution away from higher productivity manufacturing to the lower productivity service industries.

Private gross product was projected by multiplying private man-hours by output per man-hour in the private economy. Constant dollar government gross product was projected in accordance with conventional national income and product accounting practice as the number of general government employees times average compensation in the base year.

The sum of projected private and projected government gross product is projected constant dollar GNP, which grows at a compound annual rate of 4 percent between 1968 and 1990.

Since measures of gross regional product have not been constructed, it was necessary to translate GNP into measures which could be prepared regionally.

Personal income and earnings

The measures chosen for this purpose are personal income and its earnings-of-persons component (the sum of wages and salaries, other labor income, and proprietors' income). The choice rested on three considerations. First, personal income has a comparatively constant relationship to gross national product; second, its regional location is clear and can be measured with current data sources; and, third, the methodology for preparing regional estimates of personal income had already been developed.

Projected personal income was derived from the relationship between constant dollar personal income and constant dollar GNP. A function was fitted mathematically to past values of the income/GNP ratio and extended to 1990. The projected 1990 ratio was applied to projected GNP to derive projected personal income.

In a similar manner, the ratio of earnings of persons to total personal income was projected and applied to projected personal income in constant dollars to yield projected earnings in constant dollars.

Industry detail

The projected values of three national aggregate measures were disaggregated industrially. The three measures are

gross product (which at the industry level is gross product originating, or GPO), earnings of persons, and employment. The disaggregation was into the 37 industry groups for which local area data on earnings and employment are available. (When the final projections were assembled at the State level, the 37 industries were combined into 28.) The disaggregation was done by extrapolating 1948-68 trends in the industrial composition of gross product, earnings of persons, and employment; that is, each industry's share in total GNP, total earnings, and total employment was extrapolated and applied to the projected all-industry totals of GNP, earnings and employment.

The resulting projections of GNP, earnings, and employment for each industry were then reconciled. The reconciliation focused on two major considerations. First, projected industry GPO, earnings, and employment were examined in the light of historical trends in the relationships among earnings per worker, GPO per worker, and earnings as a percent of gross product. Second, those ratio relationships for each industry were reviewed in the light of the corresponding all-industry ratios, to judge how well the projected data adhered to the empirical observation that interindustry differences in earnings per worker and GPO per worker diminish over time.

The national projections of industry employment used the data on "persons engaged in production" that are calculated by BEA as an adjunct to the national income and product accounts (table 6.6 in July issues of the SURVEY). These data are conceptually consistent with the series on gross product originating and earnings. However, the "persons engaged in production" series is not available on a regional basis. The only employment data with adequate industrial detail now available for local areas are from the decennial censuses of population. It was necessary, therefore, to convert the projected national industry employment to the Census employment concepts. This was done by first eliminating government workers from the various industries.

The resulting 1960 Census employment figures for each industry were then extrapolated forward by the projected change in the "persons engaged" series (1970 Census employment data are not yet available for all States). Independently projected estimates of government employment were then added to projected private employment in the appropriate industries to yield national totals of employment for distribution to economic areas.

Economic areas

Once projections had been made at the national level for output, earnings, and employment by industry, the next step was to allocate the national industry totals to subnational areas. This was done using the 173 economic areas into which BEA has divided the country as part of its program of regional measurement, analysis, and projection. Each area has an urban center and surrounding counties where economic activity is focused, directly or indirectly, on the activity of the center. Each area combines place of residence and place of work as nearly as possible so that there is a minimum of commuting across area boundaries.

Each economic area has two types of industries. The "export" industries produce goods and services that are for the most part exported to other areas, providing the earnings with which the area purchases the specialized goods and services of other areas. "Residential" industries produce most of the services and some of the goods required by local business as intermediate products and by the household sector. Each economic area approaches self-sufficiency with respect to its residential industries.

There is general similarity among economic areas in the interindustry relationships—among "export" and residential industries—within each area. Moreover, these interindustry relationships within areas exhibit substantial stability over time, although they do change as a result of secular trends and developmental thresholds (points at

which local markets for intermediate or consumer products become large enough for local production to supplant all or a portion of imports). These characteristics of similarity and stability make the BEA economic areas superior for projection purposes to other geographic areas delineated in accordance with noneconomic criteria. For example, the relationships among industries located within a single county may appear to be meaningless and random. Such relationships would acquire meaning, of course, if data were available on the county's imports and exports so that total input requirements of each local industry could be calculated. Use of the BEA economic areas for projections and analyses makes it unnecessary to have such data for residential industries, though export-import information is still needed for the "export" industries.

Local area economic measures

The local area economic measures used in the projections are population, total personal income, earnings by industry of origin, and employment by industry.

Estimates of total personal income, earnings by industry, and the non-earnings component of personal income in each SMSA and non-SMSA county have been prepared by BEA for 1929, 1940, 1950, 1959, 1962, and annually from 1965 forward. These were aggregated to the 173 economic areas. Estimates of employment by industry for the 173 areas were based on the censuses of population for 1930, 1940, 1950, and 1960. Estimates for 1962, 1965, and 1966 were made by moving the census data forward from 1960 with employment data from *County Business Patterns*, supplemented by data from the American Railroad Association, the American Hospital Association, the Social Security Administration, State employment security agencies, and several economic censuses. Because there is very little commuting across economic area lines, the census-based employment data for economic areas, which reflect residence of the employees, are compatible with the area earnings data, which reflect place of work.

Economic area projections: "Export" industries

Projections of employment and earnings in "export" industries were made, industry by industry, for each economic area, on the basis of projections of the trend in the area's shares of total national employment and earnings in each industry. The trend in the share was projected into the future by fitting a least squares regression line to the logarithms of the historical values of the share and the logarithms of time and extending this curve to 1990. The projected shares derived in this manner were modified judgmentally in some cases, mainly where natural resources were expected to be depleted or where the historical data appeared weak or in error. The projected area shares, after being forced to total 100 percent, were applied to the appropriate national totals to get projected absolute values.

Earnings and employment in each of the "export" industries were projected independently for each economic area. Then, projected earnings per worker were calculated for each industry in each area and expressed as a percent of national earnings per worker in the industry. These ratios were a means of discovering inconsistencies between projected employment and projected earnings. When inconsistencies occurred, the data were reviewed in the light of information from other sources and the two projections were reconciled. In some instances, this review pointed clearly to the need for a change in either projected earnings or projected employment, but occasionally compromise was necessary and both were adjusted.

Economic area projections: Residential industries

Projected area earnings in each residential industry were derived from the following relationships: (1) The projected regional location quotient (LQ) for the industry, i.e., the ratio of the industry's share of total area earnings to the industry's share of total national earnings; (2) the projected national ratio of earnings in the industry to total national earnings; and (3)

projected earnings in total "export" industries in the area.

The area LQ's for each residentiary industry—item (1) above—were projected as follows. Analysis of changes in the area LQ's of individual residentiary industries from 1950 to 1969 showed that economic areas trend toward self-sufficiency in residentiary industries, i.e., LQ's trend toward 1.0. Analysis also showed that the slope of the trend depends upon the magnitude of the LQ. From this analysis, trend values for change in LQ's were set for several different ranges of LQ value. These trend values were then applied to the LQ of each residentiary industry in 1969 and projected LQ's were determined for 1980 and 1990.

The projected national ratio of earnings in each residentiary industry to total national earnings (item 2 above) was calculated from the national industry earnings projections that were mentioned as the second step of the overall projections methodology.

Item 3 was derived by summing earnings of "export" industries already projected for each economic area.

Projected earnings for each residentiary industry in each area were derived as follows: First, the projected LQ for each residentiary industry (item 1) was multiplied by the projected national ratio of earnings in that residentiary industry to total national earnings (item 2). This computation gave the projected share of the residentiary industry in the area's total all-industry earnings. These shares were summed for all residentiary industries in the area. Subtracting the sum of residentiary shares from unity gave the "export" industry share. The division of this share into the projected absolute value of "export" industry earnings—already calculated—yielded projected total all-industry earnings for the area. To this total was applied the projected share of each residentiary industry in the area's total all-industry earnings (the product of items 1 and 2) to obtain the projected absolute value of earnings in

each residentiary industry in each area. The sum of the area values for each residentiary industry was forced to equal the previously projected national total for the industry, thereby keeping the projected series within the framework of the national projections.

A comparable procedure was used to project residentiary employment by area. As in the case of the "export" industry projections, projected residentiary employment and earnings were reconciled.

Certain industries are classed as residentiary in some areas and "export" in others. For example, in one area hotels may serve principally the business community and local residents while in another, such as Las Vegas, they may provide recreation for visitors and so form an "export" industry. Similarly, in one area printing and publishing may involve only local newspaper publishing and local business printing whereas in another area it may serve a national market through book and magazine publishing. In each area, employment and earnings in such industries were projected in accordance with each industry's character in that area. This procedure necessitated a break of the projected national totals for these industries into that portion to be treated as "export" and that as residentiary.

Total earnings, the sum of "export" and residentiary industry earnings, make up about 80 percent of total personal income. To complete the projections, property income, transfer payments, and contributions to social insurance (which are netted out of personal income) were projected by a modification of the procedure used for residentiary industries.

Population projections

The natural increase in population in an area—births minus deaths—can be projected quite accurately when the national fertility rate is assumed. The critical element in a local area population projection made within a given

national population total is interarea migration. As previously noted it was assumed in these projections that the major motivating factor in migration is economic opportunity except in a few areas which attract an especially large number of retired persons. Accordingly, changes in area population were projected as a function of changes in area employment.

Historically, there has been some variation among areas in the ratio of population to employment because of differences in unemployment and in labor force participation. The projection technique recognizes these differences but assumes that they will gradually disappear. (As stated in the summary of assumptions, 4 percent unemployment was assumed nationally but not in each area separately.)

The projected increases in employment were translated into population changes by applying the projected national population/employment ratio to area changes in employment. In areas where retired persons comprise an especially large proportion of the population—and measured labor force participation is unusually low—the retirement population is projected separately from the remainder.

Historically, area per capita incomes have converged slowly toward the national average, and the projected area per capita incomes derived from projected personal income and projected population were analyzed with this in mind. In a few cases, the behavior of projected per capita income suggested need for reexamination and sometimes modification of the projected components.

State projections

The final step in deriving State projections was to separate into State segments the projections of income, employment, and population for those of the 173 BEA economic areas that cross State boundaries. State totals could then be calculated. The separation of area data into State segments was done by projecting each State's share of the area's population and of the area's income and employment, industry by

industry, on the basis of historical trends in shares. Projected State shares were applied to area totals of income, employment, and population to obtain

absolute values for each State segment. This procedure was applied to both "export" and residentiary industries, as the disaggregation of area totals into

State segments invalidated the functional relationships between "export" and residentiary industries that hold for economic areas and that can be used

Table 3.—Total Personal Income, by State and Region, for Selected Years, 1929-1990

at that level to project residuary industry activity from "export" industry activity.

The historical income estimates for SMSA's were done for each SMSA as a

whole and not for the component counties of the SMSA's. Accordingly, for the 27 SMSA's that cross State boundaries and therefore had to be disaggregated, special State breakdowns of the income

components were prepared for 1969. The percentage distributions derived from these breakdowns were used to disaggregate the projected income of each such SMSA into State segments.

The BEA figures on total and per capita income by State are expressed on a residence basis. In most States, however, the income figures would be different on a where-earned basis because

there is commuting across State boundaries. The data that are used for adjusting the State income series to a residence basis (for the basic data are on a where earned basis) are statistically

weak and no attempt was made to project such adjustments directly. Instead, per capita income in each State was projected as a function of national

(Continued on page 48)

per capita income, and multiplied by projected State population to give projected total personal income by State.

This procedure resulted in total and per capita State income being measured by place of residence. State earnings, however, were measured by place of work with one major exception: earnings of government workers reflect place of residence in both the historical and projected series. Thus, the difference between a State's total income and total earnings in table 6 is the sum of property income and transfer payments, less personal contributions for social insurance, plus an implicit commuting

adjustment. It should be noted that because of the nature of BEA economic areas, total income in them is the same whether measured by place of work or place of residence. Accordingly projected per capita income in economic areas is calculated directly as the quotient of total income and total population.

The earnings data in table 6 are shown on a place-of-work basis for two reasons. First, there is no information currently available that could be used to adjust satisfactorily the earnings data to a place-of-residence basis. Second, in most uses to which the income projections will be put, earnings serve

better on a place-of-work basis and total and per capita income are preferred on a residence basis.

Because the geographic area of the District of Columbia is quite small in comparison with that of the States, and because its future population probably depends upon the resolution of various problems more social than economic, no attempt has been made to project its population. Instead, the 1970 Census count has been held constant throughout the projection period. Earnings of persons working in the District and total personal income of the constant resident population are projected for the District of Columbia in the same manner as for the States.

(Continued from page 8)

increase (107,000) occurring in manufacturing. (Mining employment increased fairly strongly but this largely reflected the return of workers following the coal strike last year.) This was the second consecutive quarterly increase in manufacturing employment following a steep decline that began in the summer of 1969. Durable goods industries accounted for most of the recent increase.

The manufacturing workweek lengthened from an average of 40.1 hours per week in the fourth quarter to 40.3 hours in the first. The workweek increased only a little in nondurables industries, but 0.3 hours in durables. The lengthening of the workweek was fairly broad-based in durable goods manufacturing, with large increases recorded for the steel, motor vehicles and parts, and furniture and fixtures industries. Overtime in both durables and nondurables manufacturing edged up in the first quarter; for all manufacturing industries combined overtime increased 0.1 hours to 3.1 hours, continuing the slow but steady rise that began early last year.

Further indication of strengthening labor market conditions is provided by the data on labor turnover in manu-

facturing—i.e., accessions (new hires and rehires) and separations (table 7). The accessions rate declined steadily from mid-1969 through 1970, increased very modestly last year, and jumped sharply in January and February (the latest month for which data are available). The recent stepup in hiring was mainly in "new hires," that is, employees not transferred from some other establishment of the same company or recalled from layoff. The layoff rate has declined sharply, especially since last summer, and is back close to its level of early 1969. The recent increase in the quit rate is still further evidence of improved employment conditions, as quits generally move up when workers grow more optimistic about job prospects.

The labor force

The strong growth in civilian labor force and employment that has been evident since last spring continued in the first quarter, but the number of persons unemployed and the unemployment rate showed little change. The civilian labor force increased about 500,000 from the fourth quarter to the first and employment about 550,000. The

civilian labor force and employment both increased about 500,000 in the third quarter of last year and 775,000 in the fourth. (The first quarter figures are adjusted to eliminate the one-time upward shift of about 300,000 in labor force and employment due to the introduction in January of benchmark data from the 1970 Population Census.)

The essentially parallel movement of labor force and employment during the past three quarters has left the number of persons unemployed essentially unchanged at about 5 million. The unemployment rate averaged 5.8 percent in the first quarter, compared with 5.9 percent in the fourth and 6 percent in the first three quarters of last year.

First quarter employment gains for adult men and women outstripped increases in the labor force and their unemployment rates declined. The rate for adult men averaged 4.1 percent in the first quarter as compared with 4.3 to 4.4 percent last year, and the rate for women fell to 5.3 percent from last year's 5.7 to 5.8 percent range. For teenagers, labor force growth exceeded employment gains and unemployment rose; the unemployment rate averaged a record 18.2 percent in the first quarter, up from a range of 16.8 to 17.3 percent last year.

CURRENT BUSINESS STATISTICS

THE STATISTICS here update series published in the 1971 edition of BUSINESS STATISTICS, biennial statistical supplement to the SURVEY OF CURRENT BUSINESS. That volume (available from the Superintendent of Documents for \$3.00) provides a description of each series, references to sources of earlier figures, and historical data as follows: For all series, monthly or quarterly, 1967 through 1970 (1960-70 for major quarterly series), annually, 1947-70; for selected series, monthly or quarterly, 1947-70 (where available). Series added or significantly revised after the 1971 BUSINESS STATISTICS went to press are indicated by an asterisk (*) and a dagger (†), respectively; certain revisions for 1970 issued too late for inclusion in the 1971 volume appear in the monthly SURVEY beginning with the September 1971 issue. Also, unless otherwise noted, revised monthly data for periods not shown herein corresponding to revised annual data are available upon request.

The sources of the data are given in the 1971 edition of BUSINESS STATISTICS; they appear in the main descriptive note for each series, and are also listed alphabetically on pages 189-90. Statistics originating in Government agencies are not copyrighted and may be reprinted freely. Data from private sources are provided through the courtesy of the compilers, and are subject to their copyrights.

Unless otherwise stated in footnotes below, data through 1970 and descriptive notes are as shown in the 1971 edition of BUSINESS STATISTICS	1969	1970	1971	1969				1970				1971				1972

† Revised. ‡ Preliminary. § Beginning Dec. 1971, data on new basis reflect inclusion of paper issued directly by real estate investment trusts and several additional finance companies. ¶ Monthly data prior to 1969 will be available later. Revision for Nov. 1970 (1967=100). 78. § Average weekly data include claims filed under extended duration provisions of regular State laws. ⊙ Insured unemployment as % of average covered employment in a 12-month period.

⊕ Series revised to reflect recalculation of seasonal factors and trading-day adjustment; revisions for periods prior to Feb. 1971 will be shown later. ⊙ Total SMSA's include some cities and counties not designated as SMSA's. † Includes Boston, Philadelphia, Chicago, Detroit, San Francisco-Oakland and Los Angeles-Long Beach. ‡ Includes data not shown separately.

Unless otherwise stated in footnotes below, data through 1970 and descriptive notes are as shown in the 1971 edition of BUSINESS STATISTICS	1970	1971	1971												1972

† Revised. ♠ Preliminary.
 Ⓞ Average for Dec. ♀ Average for year. Ⓞ Daily average. § Revised series; details are in June 1971 Federal Reserve Bulletin.
 Ⓞ For demand deposits, the term "adjusted" denotes demand deposits other than domestic commercial bank and U.S. Government, less cash items in process of collection; for loans, exclusive of loans to and Federal funds transactions with domestic commercial banks and after deduction of valuation reserves (individual loan items are shown gross; i.e., before deduction of valuation reserves).
 Ⓞ Revisions for months prior to Feb. 1971 will be shown later.
 Ⓞ Includes data not shown separately. Ⓞ Adjusted to exclude interbank loans.
 § For bond yields, see p. S-20.

Unless otherwise stated in footnotes below, data through 1970 and descriptive notes are as shown in the 1971 edition of BUSINESS STATISTICS	1970	1971	1971										1972

¹ Revised. ² Preliminary. ³ End of year. *New series; more detailed information appears in the February 1972 Federal Reserve Bulletin.
⁴ Includes data not shown separately. ⁵ Beginning April 1971 SURVEY, data restated to include "other transportation" in addition to railroad data formerly shown.

⁶ Number of bonds represented fluctuates; the change in the number does not affect the continuity of the series.

⁷ Prices are derived from average yields on basis of an assumed 3 percent 20-year bond.
⁸ For bonds due or callable in 10 years or more.

Unless otherwise stated in footnotes below, data through 1970 and descriptive notes are as shown in the 1971 edition of BUSINESS STATISTICS	1970		1971												1972

[♀] Revised. [♂] Preliminary. [⊙] Annual total reflects revisions not distributed to monthly or quarterly data.
[♀] Includes data not shown separately.
[♂] Applies to passengers, baggage, cargo, and mail carried.

[♂] Passenger-miles as a percent of available seat-miles in revenue service; reflects proportion of seating capacity actually sold and utilized. [⊙] Total revenues, expenses, and income for all groups of carriers also reflect nonscheduled service.

Unless otherwise stated in footnotes below, data through 1970 and descriptive notes are as shown in the 1971 edition of BUSINESS STATISTICS

[⊕] Revised.
¹ Reported annual total reflecting revisions not distributed to the monthly data. ² Series discontinued.
³ Less than 500 short tons. ⁴ Annual total reflects sulfur content, whereas monthly data are gross weight. ⁵ Gross weight. ⁶ Beginning Jan. 1972, data exclude polyvinyl acetate, polyvinyl alcohol, and other vinyl resins; comparable Dec. 1971 figure, 320.1 mil. lb.

⊕ Scattered revisions have been made in the annual data back to 1967; monthly revisions are not available.
[⊕] Data are reported on the basis of 100 percent content of the specified material unless otherwise indicated. [⊕] Includes data not shown separately.
[§] Data exclude black blasting powder.
[‡] Revised monthly data for 1970 will be shown later.

Unless otherwise stated in footnotes below, data through 1970 and descriptive notes are as shown in the 1971 edition of BUSINESS STATISTICS	1970	1971	1971										1972

*New series, Industrial supplies (marketed through distributors)—orders index (American Supply & Machinery Mfrs. Assn.), based on 2-month moving average of selected members' new orders, is also adjusted for number of working days. Sales index (National and Southern Industrial Distributors Assns.) is based on selected panel of members' operations which cover national sales for maintenance, repair, and operations for all types of industries. Dishwashers and disposers (Assn. of Home Appliance Mfrs.) and gas equipment (Gas Appliance Mfrs. Assn.) reflect total industry sales. Monthly data prior to 1971 are available upon request.

Unless otherwise stated in footnotes below, data through 1970 and descriptive notes are as shown in the 1971 edition of BUSINESS STATISTICS	1970	1971	1971										1972

¹ Revised. ² Reported annual total; revisions not allocated to the months or quarter.
³ Data cover 5 weeks; other months, 4 weeks. ⁴ Ginnings to Dec. 13. ⁵ Ginnings to Jan. 16. ⁶ Crop for the year 1970. ⁷ Crop for the year 1971. ⁸ Includes data not shown separately.

⁹ Unfilled orders cover wool apparel (including polyester-wool) finished fabrics; production and stocks exclude figures for such finished fabrics. Orders also exclude bedsheeting, toweling, and blanketing.

¹⁰ Total ginnings to end of month indicated, except as noted.

¹¹ Stocks (owned by weaving mills and billed and held for others) exclude bedsheeting, toweling, and blanketing, and billed and held stocks of denims.

Unless otherwise stated in footnotes below, data through 1970 and descriptive notes are as shown in the 1971 edition of BUSINESS STATISTICS	1970	1971	1971										1972

INDEX TO CURRENT BUSINESS STATISTICS, Pages 51-540

SECTIONS

General:

Business indicators	1-7
Commodity prices	7-9
Construction and real estate	9, 10
Domestic trade	11, 12
Labor force, employment, and earnings	13-16
Finance	16-21
Foreign trade of the United States	21-23
Transportation and communications	23, 24

Industry:

Chemicals and allied products	24, 25
Electric power and gas	25, 26
Food and kindred products, tobacco	26-30
Leather and products	30
Lumber and products	31
Metals and manufactures	31-34
Petroleum, coal, and products	34-36
Pulp, paper, and paper products	36, 37
Rubber and rubber products	37
Stone, clay, and glass products	38
Textile products	38-40
Transportation equipment	40

INDIVIDUAL SERIES

Advertising	11, 16
Aerospace vehicles	4, 40
Agricultural loans	23
Air carrier operations	23

The shifting pattern and composition of U.S. merchandise exports and imports over the past half century are shown in an economically meaningful statistical framework developed by the Office of Business Economics

U.S. EXPORTS AND IMPORTS CLASSIFIED BY OBE END-USE COMMODITY CATEGORIES, 1923-68

- The sole source of consistent comparable trade totals. Currently published trade statistics can be used for updating.
- Nearly 14,000 individual commodity codes of the Census Bureau are reclassified and consolidated into 226 end-use groupings that can be associated with the principal sectors of the U.S. economy.
- The end-use classification system, explained in this volume, provides a convenient and efficient statistical tool for both descriptive and economic analyses of short- and long-run movements in U.S. merchandise trade.
- The end-use classification system facilitates comparison between trade and cyclical movements in the economy.
- End-use export and import data are also shown by geographic areas that conform with the area presentation in balance of payment tables appearing in the Survey of Current Business.
- The current volume represents a comprehensive restructuring, revision, and updating of the historical end-use data first published in the Balance of Payments Supplement to the Survey of Current Business in 1963.
