REAL GROSS domestic product (GDP) increased 2.6 percent at an annual rate in the fourth quarter of 2014 after increasing 5.0 percent in the third quarter, according to the advance estimates of the national income and product accounts (NIPAs) (chart 1 and table 1). For the year 2014, real GDP increased 2.4 percent after increasing 2.2 percent in 2013 (see page 6).

The slowdown in real GDP growth in the fourth quarter primarily reflected an upturn in imports, a downturn in federal government spending, and slowdowns in nonresidential fixed investment and in exports that were partly offset by an upturn in inventory investment and a pickup in consumer spending.

- Prices of goods and services purchased by U.S. residents decreased 0.3 percent in the fourth quarter after increasing 1.4 percent in the third quarter. Food prices slowed in the fourth quarter, and energy prices decreased much more in the fourth quarter than in the third quarter. Excluding food and energy, gross domestic purchases prices increased 0.7 percent after increasing 1.6 percent (see table 2).
- Real disposable personal income (DPI) increased 3.8 percent in the fourth quarter after increasing 2.0 percent in the third quarter. Current-dollar DPI increased 3.3 percent in the fourth quarter, the same increase as in the third quarter (see table 3). The acceleration in real DPI reflected a downturn in the implicit price deflator for consumer spending, which is used to deflate DPI.
- The personal saving rate, personal saving as a percentage of current-dollar DPI, was 4.6 percent in the fourth quarter; in the third quarter, the rate was 4.7 percent.

Lisa S. Mataloni prepared this article.

</tbody>
</table>

Consumer spending picked up in the fourth quarter, reflecting pickups in both services (mainly household utilities) and goods (primarily clothing and footwear and gasoline and other energy goods).

Nonresidential fixed investment slowed, primarily reflecting a downturn in equipment (primarily in transportation and industrial equipment).

Inventory investment turned up, primarily reflecting an upturn in nonfarm inventory investment, specifically an upturn in manufacturing and a pickup in wholesale trade that were partly offset by a larger decrease in retail trade.

Exports of goods and services slowed, reflecting a slowdown in goods exports that was partly offset by an upturn in services exports.

Imports of goods and services turned up in the fourth quarter, reflecting an upturn in goods imports and a pickup in services imports.

The upturn in goods imports primarily reflected upturns in consumer goods except food and automotive and in petroleum and products.

Federal government spending turned down; the downturn was more than accounted for by a downturn in national defense spending that primarily reflected a large downturn in intermediate services purchased (specifically personnel support services).

Real final sales of domestic product, real GDP less inventory investment, increased 1.8 percent in the fourth quarter after increasing 5.0 percent in the third quarter.

---

1. The estimates of GDP under the contribution columns are also percent changes.

Notes: Percent changes are from NIPA tables 1.1.1 and 1.2.1, contributions are from NIPA tables 1.1.2 and 1.2.2, and shares are from NIPA table 1.1.10, or they are calculated from NIPA table 1.2.5.
BEA’s gross domestic purchases price index is the most comprehensive index of prices paid by U.S. residents for all goods and services. It is derived from the prices of personal consumption expenditures (PCE), private investment, and government consumption expenditures and gross investment.

BEA also produces price indexes for all the components of GDP. The PCE price index is a measure of the total cost of consumer goods and services, including durable goods, nondurable goods, and services. PCE prices for food, for energy goods and services, and for all items except food and energy are also estimated and reported.

Because prices for food and for energy can be volatile, the price measure that excludes food and energy is often used as a measure of underlying, or “core,” inflation. The core PCE price index includes purchased meals and beverages, such as restaurant meals and pet food. (See the FAQ “What is the core PCE price index?” on BEA’s Web site.)

BEA also prepares a supplemental PCE price index, the “market-based” PCE price index, that is based on market transactions for which there are corresponding price measures. This index excludes many imputed expenditures, such as financial services furnished without payment, that are included in PCE and in the PCE price index. BEA also prepares a market-based measure that excludes food and energy.

Note on Prices

Prices paid by U.S. residents, as measured by the gross domestic purchases price index, turned down, decreasing 0.3 percent in the fourth quarter after increasing 1.4 percent in the third quarter. The downturn primarily reflected downturns in consumer spending prices and in prices paid by state and local governments.

The downturn in consumer spending prices primarily reflected a downturn in the prices paid for goods (mainly a larger decrease in the prices paid for gasoline and other energy goods).

Prices paid by state and local governments turned down, decreasing 0.8 percent after increasing 2.1 percent. The downturn primarily reflected a downturn in the prices paid for consumption expenditures, mainly intermediate goods (specifically petroleum products).

Consumer prices excluding food and energy, a measure of the “core” rate of inflation, slowed, increasing 1.1 percent after increasing 1.4 percent.

### Addenda: The effects of special factors on changes in DPI

- In government compensation:
  - Federal pay raise: 2.6
  - Moral and charitable contributions: 0.3
  - Personal saving: 0.0
- In supplements to wages and salaries:
  - FICA increase in maximum taxable wages: 1.7
  - Medicare: 0.0
- In government social benefits to persons:
  - Cost-of-living adjustments (COLAs) 1: 14.2
  - Automatic Earnings Reappraisal Operation: −2.7
  - Emergency unemployment compensation: −17.5
  - ACA premium assistance tax credit: 7.0
  - Other refundable tax credits: 3.1
- In employee contributions for government social insurance:
  - FICA and SECA increase in maximum taxable wages: 2.1
  - SMI premium: 0.0
  - Additional hospital insurance tax: 0.0
  - Expiration of the "payroll tax holiday": 2.6
- In personal current taxes:
  - Refunds, settlements, and back taxes: −8.1

1. Includes COLAs for social security, veterans benefits, railroad retirement, and supplemental security income.

Personal income, which is measured in current dollars, accelerated in the fourth quarter, increasing $136.8 billion after increasing $131.6 billion in the third quarter. The acceleration primarily reflected accelerations in wages and salaries and in proprietors’ income that were partly offset by a deceleration in government social benefits to persons and a larger decrease in personal interest income.

The pickup in wages and salaries reflected an acceleration in services-producing industries and a smaller acceleration in goods-producing industries.

The pickup in proprietors’ income reflected a smaller decrease in farm proprietors’ income and a pickup in nonfarm proprietors’ income.

Personal interest income decreased $9.5 billion after decreasing $3.5 billion.

The deceleration in government social benefits to persons primarily reflected a slowdown in Medicaid benefits.

Personal saving—disposable personal income less personal outlays—was $601.7 billion in the fourth quarter, decreasing $15.5 billion after decreasing $38.4 billion.

The personal saving rate was 4.6 percent in the fourth quarter; in the third quarter, the rate was 4.7 percent.

¹. All the values except the value for inventory investment for nondurable manufacturing are assumptions. ². Nonmonetary gold is included in balance-of-payments exports and imports, but it is not used directly in estimating exports and imports in the national income and product accounts.

The advance estimates of many components of GDP are based on 3 months of source data, but the estimates of some components are based on only 2 months of data. For the following items, the number of months for which data are available is shown in parentheses.

Consumer spending: sales of retail stores (3), unit auto and truck sales (3), consumers’ shares of auto and truck sales (2), motor vehicle fuels data (1), and electricity and gas usage and unit-value data (1);

Nonresidential fixed investment: unit auto and truck sales (3), construction spending (value put in place) (2), manufacturers’ shipments of machinery and equipment (3), and exports and imports of machinery and equipment (2);

Residential fixed investment: construction spending (value put in place) (2), single-family housing starts (3), sales of new homes (3), and sales of existing houses (3);

Inventory investment: trade and nondurable-goods manufacturing inventories (2), durable-goods manufacturing inventories (3), and unit auto and truck inventories (3);

Net exports of goods and services: exports and imports of goods and services (2) and values and quantities of petroleum imports (2);

Government spending: federal government outlays (3), state and local government construction spending (value put in place) (2), and federal and state and local government employment (3);

Compensation: private employment, average hourly earnings, and average weekly hours (3); and

Prices: consumer price indexes (3), producer price indexes (3), and export and import price indexes (3).

Key assumptions

When source data were unavailable, BEA made various assumptions for December, including the following (table 4):

• An increase in nonresidential structures,
• An increase in single-family structures,
• An increase in multifamily structures,
• A decrease in nondurable-goods manufacturing inventories,
• An increase in nonmotor vehicle merchant wholesale and retail inventories,
• A decrease in exports of goods excluding gold and an increase in imports of goods excluding gold, and
• An increase in state and local government construction spending.

A more comprehensive list is available on BEA’s Web site.
Real GDP for 2014

Real GDP accelerated in 2014, primarily reflecting an acceleration in nonresidential fixed investment, a smaller decrease in federal government spending, and accelerations in inventory investment, in consumer spending, and in state and local government spending that were partly offset by an acceleration in imports and a deceleration in residential fixed investment.

Consumer spending added 1.72 percentage points to the change in real GDP in 2014 after adding 1.64 percentage points in 2013. The main contributor was a slight pickup in spending on services.

The acceleration in nonresidential fixed investment primarily reflected an upturn in structures, mainly power and communication structures.

Residential fixed investment added 0.05 percentage point to the change in real GDP in 2014 after adding 0.33 percentage point in 2013.

Inventory investment added 0.15 percentage point to the change in real GDP after adding 0.06 percentage point.

Imports subtracted 0.64 percentage point from the change in real GDP after subtracting 0.19 percentage point. The pickup in imports primarily reflected a pickup in imports of goods.

Federal government spending subtracted 0.14 percentage point from the change in real GDP in 2014 after subtracting 0.45 percentage point in 2013.

State and local government spending added 0.11 percentage point to the change in real GDP after adding 0.06 percentage point.
