EMBARGOED UNTIL RELEASE AT 8:30 A.M. EDT, WEDNESDAY, JUNE 29, 2005

Virginia H. Mannering: (202) 606-5304 (GDP)  
Greg Key: (202) 606-9727 (Profits)  
Recorded message: (202) 606-5306

BEA 05-30

**GROSS DOMESTIC PRODUCT: FIRST QUARTER 2005 (FINAL)  
CORPORATE PROFITS: FIRST QUARTER 2005 (FINAL)**

Real gross domestic product -- the output of goods and services produced by labor and property located in the United States -- increased at an annual rate of 3.8 percent in the first quarter of 2005, according to final estimates released by the Bureau of Economic Analysis. In the fourth quarter, real GDP also increased 3.8 percent.

The GDP estimates released today are based on more complete source data than were available for the preliminary estimates issued last month. In the preliminary estimates, the increase in real GDP was 3.5 percent (see "Revisions" on page 3).

The major contributors to the increase in real GDP in the first quarter were personal consumption expenditures (PCE), exports, private inventory investment, residential fixed investment, and equipment and software. Imports, which are a subtraction in the calculation of GDP, increased.

Annual Revision of the National Income and Product Accounts

The annual revision of the national income and product accounts, covering the first quarter of 2002 through the first quarter of 2005, will be released along with the "advance" estimate of GDP for the second quarter of 2005 on July 29. An article describing the revision will appear in the August 2005 issue of the *Survey of Current Business*.

---

NOTE.--Quarterly estimates are expressed at seasonally adjusted annual rates, unless otherwise specified. Quarter-to-quarter dollar changes are differences between these published estimates. Percent changes are calculated from unrounded data and are annualized. "Real" estimates are in chained (2000) dollars. Price indexes are chain-type measures.

This news release is available on BEA's Web site at [www.bea.gov/bea/rels.htm](http://www.bea.gov/bea/rels.htm).

The growth rate of real GDP in the first quarter was the same as that in the fourth. In the first quarter, accelerations in exports, in residential fixed investment, and in private inventory investment and a deceleration in imports were offset by decelerations in equipment and software and in PCE.

Final sales of computers contributed 0.48 percentage point to the first-quarter change in real GDP after contributing 0.56 percentage point to the fourth-quarter change. Motor vehicle output contributed 0.24 percentage point to the first-quarter change in real GDP after contributing 0.86 percentage point to the fourth-quarter change.

The price index for gross domestic purchases, which measures prices paid by U.S. residents, increased 2.7 percent in the first quarter, 0.2 percentage point less than the preliminary estimate; this index increased 2.9 percent in the fourth quarter. Excluding food and energy prices, the price index for gross domestic purchases increased 2.7 percent in the first quarter, compared with an increase of 2.0 percent in the fourth. About 0.2 percentage point of the first-quarter increase in the index was accounted for by the pay raise for federal civilian and military personnel, which is treated as an increase in the price index of employee services purchased by the federal government.

Real personal consumption expenditures increased 3.6 percent in the first quarter, compared with an increase of 4.2 percent in the fourth. Real nonresidential fixed investment increased 4.1 percent, compared with an increase of 14.5 percent. Nonresidential structures decreased 2.4 percent, in contrast to an increase of 2.1 percent. Equipment and software increased 6.1 percent, compared with an increase of 18.4 percent. Real residential fixed investment increased 11.5 percent, compared with an increase of 3.4 percent.

Real exports of goods and services increased 8.9 percent in the first quarter, compared with an increase of 3.2 percent in the fourth. Real imports of goods and services increased 9.6 percent, compared with an increase of 11.4 percent.

Real federal government consumption expenditures and gross investment increased 0.6 percent in the first quarter, compared with an increase of 1.2 percent in the fourth. National defense increased 0.5 percent, in contrast to a decrease of 0.6 percent. Nondefense increased 0.9 percent, compared with an increase of 5.3 percent. Real state and local government consumption expenditures and gross investment decreased 0.1 percent, in contrast to an increase of 0.6 percent.

The real change in private inventories added 0.72 percentage point to the first-quarter change in real GDP after adding 0.46 percentage point to the fourth-quarter change. Private businesses increased inventories \$66.8 billion in the first quarter, following increases of \$47.2 billion in the fourth quarter and \$34.5 billion in the third.

Real final sales of domestic product -- GDP less change in private inventories -- increased 3.0 percent in the first quarter, compared with an increase of 3.4 percent in the fourth.

### **Gross domestic purchases**

Real gross domestic purchases -- purchases by U.S. residents of goods and services wherever produced -- increased 4.1 percent in the first quarter, compared with an increase of 5.0 percent in the fourth.

### **Gross national product**

Real gross national product -- the goods and services produced by the labor and property supplied by U.S. residents -- increased 3.9 percent in the first quarter, compared with an increase of 3.5 percent in the fourth. GNP includes, and GDP excludes, net receipts of income from the rest of the world, which increased \$2.7 billion in the first quarter after decreasing \$9.7 billion in the fourth; in the first quarter, receipts decreased \$2.7 billion, and payments decreased \$5.4 billion.

### **Current-dollar GDP**

Current-dollar GDP -- the market value of the nation's output of goods and services -- increased 6.7 percent, or \$196.9 billion, in the first quarter to a level of \$12,191.7 billion. In the fourth quarter, current-dollar GDP increased 6.2 percent, or \$179.9 billion.

### **Revisions**

The final estimate of the first-quarter increase in real GDP is 0.3 percentage point, or \$7.4 billion, higher than the preliminary estimate issued last month. The upward revision to the percentage change in real GDP primarily reflected upward revisions to exports and to residential fixed investment.

	<u>Advance</u> (Percent change from preceding quarter)	<u>Preliminary</u>	<u>Final</u>
Real GDP.....	3.1	3.5	3.8
Current-dollar GDP.....	6.4	6.7	6.7
Gross domestic purchases price index....	3.0	2.9	2.7

### **Corporate Profits**

Profits from current production (corporate profits with inventory valuation and capital consumption adjustments) increased \$76.1 billion in the first quarter. In the fourth quarter, profits increased \$150.8 billion. Current-production cash flow (net cash flow with inventory valuation and capital consumption adjustments) -- the internal funds available to corporations for investment -- increased \$103.3 billion in the first quarter, in contrast to a decrease of \$37.7 billion in the fourth.

Taxes on corporate income increased \$64.3 billion in the first quarter, compared with an increase of \$42.4 billion in the fourth. Profits after tax with inventory valuation and capital consumption adjustments increased \$11.9 billion in the first quarter, compared with an increase of \$108.3 billion in the fourth. Dividends decreased \$91.9 billion, in contrast to an increase of \$110.7 billion; current-production undistributed profits increased \$103.8 billion, in contrast to a decrease of \$2.4 billion.

Domestic profits of financial corporations increased \$36.7 billion in the first quarter, compared with an increase of \$84.1 billion in the fourth.

Domestic profits of nonfinancial corporations increased \$24.5 billion in the first quarter, compared with an increase of \$66.7 billion in the fourth. In the first quarter, real gross corporate product increased, and profits per unit of real product increased. The increase in unit profits reflected an increase in unit prices that was partly offset by an increase in unit labor costs; unit nonlabor costs decreased.

The rest-of-the-world component of profits increased \$14.8 billion in the first quarter, following no change in the fourth. This measure is calculated as (1) receipts by U.S. residents of earnings from their foreign affiliates plus dividends received by U.S. residents from unaffiliated foreign corporations minus (2) payments by U.S. affiliates of earnings to their foreign parents plus dividends paid by U.S. corporations to unaffiliated foreign residents. The first-quarter increase was accounted for by a larger decrease in payments than in receipts.

Profits before tax with inventory valuation adjustment is the best available measure of industry profits because estimates of the capital consumption adjustment by industry do not exist. This measure reflects the depreciation-accounting practices used for federal income tax returns. According to this measure, domestic profits of both financial and nonfinancial corporations increased. The increase in the profits of nonfinancial corporations was largely in "other" nonfinancial, in nondurable manufacturing, and in information.

Profits before tax increased \$266.1 billion in the first quarter, compared with an increase of \$125.1 billion in the fourth. The before-tax measure of profits does not reflect, as does profits from current production, the capital consumption and inventory valuation adjustments. These adjustments convert depreciation of fixed assets and inventory withdrawals reported on a tax-return, historical-cost basis to the current-cost measures used in the national income and product accounts. The capital consumption adjustment decreased \$198.7 billion in the first quarter (from \$260.0 billion to \$61.3 billion), in contrast to an increase of \$37.0 billion in the fourth. The large increase in first-quarter profits before tax and the large decrease in the first-quarter capital consumption adjustment reflect the expiration of the "bonus" depreciation provisions of both the Job Creation and Worker Assistance Act of 2002 and the Jobs and Growth Tax Relief Reconciliation Act of 2003. The inventory valuation adjustment increased \$8.7 billion (from -\$49.1 billion to -\$40.4 billion), in contrast to a decrease of \$11.3 billion.

BEA's national, international, regional, and industry estimates; the *Survey of Current Business*; and BEA news releases are available without charge on BEA's Web site at [www.bea.gov](http://www.bea.gov). By visiting the site, you can also subscribe to receive free e-mail summaries of BEA releases and announcements.

Summary BEA estimates are available on recorded messages at the time of public release at the following telephone numbers:

r Revised.

1. This index is a supplemental measure that is based on household expenditures for which there are observable price measures. It excludes most implicit prices (for example, the services furnished without payment by financial intermediaries) and the expenses of nonprofit institutions. Percentage changes for these series are included in the addenda to table 8 and appendix table A.

See "Explanatory Note" at the end of the tables.

r Revised.

1. Personal income is also equal to national income less corporate profits with inventory valuation and capital consumption adjustments, taxes on production and imports less subsidies, contributions for government social insurance, net interest and miscellaneous payments, business current transfer payments, current surplus of government enterprises, and wage accruals less disbursements, plus personal income receipts on assets, and personal current transfer receipts.

2. Equals disposable personal income deflated by the implicit price deflator for personal consumption expenditures.

r Revised.

1. Effective December 22, 2004, chained-dollar gross value added of nonfinancial corporate business was revised beginning with 1929. The current-dollar gross value added is deflated by a revised chain-type price index calculated using the gross value added chain-type price index for nonfinancial industries from the comprehensive revision of the GDP-by-industry accounts.

2. Chained-dollar consumption of fixed capital of nonfinancial corporate business is calculated as the product of

the chain-type quantity index and the 2000 current-dollar value of the corresponding series, divided by 100.

3. Chained-dollar net value added of nonfinancial corporate business is the difference between the gross value added and the consumption of fixed capital.

4. The deflator for gross value added of nonfinancial corporate business divided by 100.

NOTE.—Estimates in this table are based on the 1997 North American Industry Classification System (NAICS).

r Revised.

1. For some components of final sales of computers, includes computer parts.

2. Farm output less intermediate goods and services purchased.

3. Consists of GDP less gross value added of farm, of households and institutions, and of general government.

4. This index is a supplemental measure that is based on household expenditures for which there are observable price measures. It excludes most implicit prices (for example, the services furnished without payment by financial intermediaries) and the expenses of nonprofit institutions.

See "Explanatory Note" at the end of the tables.

## **Explanatory Note: NIPA Measures of Quantities and Prices**

Current-dollar GDP is a measure of the market value of goods, services, and structures produced in the economy in a particular period. Changes in current-dollar GDP can be decomposed into quantity and price components. Quantities, or "real" measures, and prices are expressed as index numbers with the reference year -- at present, the year 2000 -- equal to 100.

Annual changes in quantities and prices are calculated using a Fisher formula that incorporates weights from two adjacent years. (Quarterly changes in quantities and prices are calculated using a Fisher formula that incorporates weights from two adjacent quarters; quarterly indexes are adjusted for consistency to the annual indexes before percent changes are calculated.) For example, the 2002-03 annual percent change in real GDP uses prices for 2002 and 2003 as weights, and the 2002-03 annual percent change in GDP prices uses quantities for 2002 and 2003 as weights. These annual changes are "chained" (multiplied) together to form time series of quantity and price indexes. Percent changes in Fisher indexes are not affected by the choice of reference year. (BEA also publishes a measure of the price level known as the implicit price deflator (IPD), which is calculated as the ratio of the current-dollar value to the corresponding chained-dollar value, multiplied by 100. The values of the IPD are very close to the values of the corresponding "chain-type" price index.)

Index numbers of quantity and price indexes for GDP and its major components are presented in this release in tables 5 and 6. Percent changes from the preceding period are presented in tables 1, 4, 7, and 8. Contributions by major components to changes in real GDP are presented in table 2.

Measures of real GDP and its major components are also presented in dollar-denominated form, designated "chained (2000) dollar estimates." For most series, these estimates, which are presented in table 3, are computed by multiplying the current-dollar value in 2000 by a corresponding quantity index number and then dividing by 100. For example, if a current-dollar GDP component equaled \$100 in 2000 and if real output for this component increased 10 percent in 2001, then the chained (2000) dollar value of this component in 2001 would be \$110 ( $= \$100 \times 110 / 100$ ). Percent changes calculated from chained-dollar estimates and from chain-type quantity indexes are the same; any differences will be small and due to rounding.

Chained-dollar values for the detailed GDP components will not necessarily sum to the chained-dollar estimate of GDP (or to any intermediate aggregate). This is because the relative prices used as weights for any period other than the reference year differ from those of the reference year. A measure of the extent of such differences is provided by a "residual" line, which indicates the difference between GDP (or other major aggregate) and the sum of the most detailed components in the table. For periods close to the reference year, when there usually has not been much change in the relative prices that are used as weights, the residuals tend to be small, and the chained-dollar estimates can be used to approximate the contributions to growth and to aggregate the detailed estimates. For periods further from the reference year, the residuals tend to be larger, and the chained-dollar estimates are less useful for analyses of contributions to growth. Thus, the contributions to percent change shown in table 2 provide a better measure of the composition of GDP growth. In particular, for components for which relative prices are changing rapidly, calculation of contributions using chained-dollar estimates may be misleading even just a few years from the reference year.
