

News Release

EMBARGOED UNTIL RELEASE AT 8:30 A.M. EDT, FRIDAY, APRIL 26, 2019

BEA 19-17

Technical: Lisa Mataloni (301) 278-9083 gdpniwd@bea.gov

Media: Jeannine Aversa (301) 278-9003 Jeannine.Aversa@bea.gov

Gross Domestic Product, First Quarter 2019 (Advance Estimate)

Real gross domestic product (GDP) increased at an annual rate of 3.2 percent in the first quarter of 2019 (table 1), according to the "advance" estimate released by the Bureau of Economic Analysis. In the fourth quarter of 2018, real GDP increased 2.2 percent.

The Bureau's first-quarter advance estimate released today is based on source data that are incomplete or subject to further revision by the source agency (see "Source Data for the Advance Estimate" on page 2). The "second" estimate for the first quarter, based on more complete data, will be released on May 30, 2019.

The increase in real GDP in the first quarter reflected positive contributions from personal consumption expenditures (PCE), private inventory investment, exports, state and local government spending, and nonresidential fixed investment. Imports, which are a subtraction in the calculation of GDP, decreased (table 2). These contributions were partly offset by a decrease in residential investment.

The acceleration in real GDP growth in the first quarter reflected an upturn in state and local government spending, accelerations in private inventory investment and in exports, and a smaller decrease in residential investment. These movements were partly offset by decelerations in PCE and nonresidential fixed investment, and a downturn in federal government spending. Imports, which are a subtraction in the calculation of GDP, turned down.

Current-dollar GDP increased 3.8 percent, or \$197.6 billion, in the first quarter to a level of \$21.06 trillion. In the fourth quarter, current-dollar GDP increased 4.1 percent, or \$206.9 billion (table 1 and table 3).

The **price index for gross domestic purchases** increased 0.8 percent in the first quarter, compared with an increase of 1.7 percent in the fourth quarter (table 4). **The PCE price index** increased 0.6 percent, compared with an increase of 1.5 percent. Excluding food and energy prices, the PCE price index increased 1.3 percent, compared with an increase of 1.8 percent.

Personal Income (table 8)

Current-dollar personal income increased \$147.2 billion in the first quarter, compared with an increase of \$229.0 billion in the fourth quarter. The deceleration reflected downturns in personal interest income, personal dividend income, and proprietors' income that were partly offset by an acceleration in personal current transfer receipts.

Disposable personal income increased \$116.0 billion, or 3.0 percent, in the first quarter, compared with an increase of \$222.9 billion, or 5.8 percent, in the fourth quarter. **Real disposable personal income** increased 2.4 percent, compared with an increase of 4.3 percent.

Personal saving was \$1.11 trillion in the first quarter, compared with \$1.07 trillion in the fourth quarter. The **personal saving rate** -- personal saving as a percentage of disposable personal income -- was 7.0 percent in the first quarter, compared with 6.8 percent in the fourth quarter.

Source Data for the Advance Estimate

Information on the source data and key assumptions used for unavailable source data in the advance estimate is provided in a <u>Technical Note</u> that is posted with the news release on BEA's Web site. A detailed "<u>Key Source Data and Assumptions</u>" file is also posted for each release. For information on updates to GDP, see the "Additional Information" section that follows.

Upcoming Annual Update of the National Income and Product Accounts

The annual update of the national income and product accounts, covering the first quarter of 2014 through the first quarter of 2019, will be released along with the "advance" estimate of GDP for the second quarter of 2019 on July 26. For more information, see the <u>Technical Note</u>.

Definitions

Gross domestic product (GDP) is the value of the goods and services produced by the nation's economy less the value of the goods and services used up in production. GDP is also equal to the sum of personal consumption expenditures, gross private domestic investment, net exports of goods and services, and government consumption expenditures and gross investment.

Gross domestic income (GDI) is the sum of incomes earned and costs incurred in the production of GDP. In national economic accounting, GDP and GDI are conceptually equal. In practice, GDP and GDI differ because they are constructed using largely independent source data. Real GDI is calculated by deflating gross domestic income using the GDP price index as the deflator and is therefore conceptually equivalent to real GDP.

Current-dollar estimates are valued in the prices of the period when the transactions occurred—that is, at "market value." Also referred to as "nominal estimates" or as "current-price estimates."

Real values are inflation-adjusted estimates—that is, estimates that exclude the effects of price changes.

The *gross domestic purchases price index* measures the prices of final goods and services purchased by U.S. residents.

The *personal consumption expenditure price index* measures the prices paid for the goods and services purchased by, or on the behalf of, "persons."

Personal income is the income received by, or on behalf of, all persons from all sources: from participation as laborers in production, from owning a home or business, from the ownership of financial assets, and from government and business in the form of transfers. It includes income from domestic sources as well as the rest of world. It does not include realized or unrealized capital gains or losses.

Disposable personal income is the income available to persons for spending or saving. It is equal to personal income less personal current taxes.

Personal outlays is the sum of personal consumption expenditures, personal interest payments, and personal current transfer payments.

Personal saving is personal income less personal outlays and personal current taxes.

The *personal saving rate* is personal saving as a percentage of disposable personal income.

Profits from current production, referred to as corporate profits with inventory valuation adjustment (IVA) and capital consumption adjustment (CCAdj) in the National Income and Product Accounts (NIPAs), is a measure of the net income of corporations before deducting income taxes that is consistent with the value of goods and services measured in GDP. The IVA and CCAdj are adjustments that convert inventory withdrawals and depreciation of fixed assets reported on a tax-return, historical-cost basis to the current-cost economic measures used in the national income and product accounts. Profits for domestic industries reflect profits for all corporations located within the geographic borders of the United States. The rest-ofthe-world (ROW) component of profits is measured as the difference between profits received from ROW and profits paid to ROW.

For more definitions, see the <u>Glossary: National Income and Product Accounts</u>.

Statistical conventions

Annual-vs-quarterly rates. Quarterly seasonally adjusted values are expressed at annual rates, unless otherwise specified. This convention is used for BEA's featured, seasonally adjusted measures to facilitate comparisons with related and historical data. For details, see the FAQ "Why does BEA publish estimates at annual rates?" Quarterly not seasonally adjusted values are expressed only at quarterly rates.

Percent changes. Percent changes in quarterly seasonally adjusted series are displayed at annual rates, unless otherwise specified. For details, see the FAQ "How is average annual growth calculated?" Percent changes in quarterly not seasonally adjusted values are calculated from the same quarter one year ago. All published percent changes are calculated from unrounded data.

Calendar years and quarters. Unless noted otherwise, annual and quarterly data are presented on a calendar basis.

Quantities and prices. Quantities, or "real" volume measures, and prices are expressed as index numbers with a specified reference year equal to 100 (currently 2012). Quantity and price indexes are calculated using a Fisherchained weighted formula that incorporates weights from two adjacent periods (quarters for quarterly data and annuals for annual data). For details on the calculation of quantity and price indexes, see Chapter 4: Estimating Methods in the NIPA Handbook.

Chained-dollar values are calculated by multiplying the quantity index by the current dollar value in the reference year (2012) and then dividing by 100. Percent changes calculated from real quantity indexes and chained-dollar levels are conceptually the same; any differences are due to rounding. Chained-dollar values are not additive because the relative weights for a given period differ from those of the reference year. In tables that display chained-dollar values, a "residual" line shows the difference between the sum of detailed chained-dollar series and its corresponding aggregate.

Updates to GDP

BEA releases three vintages of the current quarterly estimate for GDP: "Advance" estimates are released near the end of the first month following the end of the quarter and are based on source data that are incomplete or subject

to further revision by the source agency; "second" and "third" estimates are released near the end of the second and third months, respectively, and are based on more detailed and more comprehensive data as they become available.

Annual and comprehensive updates are typically released in late July. Annual updates generally cover at least the 5 most recent calendar years (and their associated quarters) and incorporate newly available major annual source data as well as some changes in methods and definitions to improve the accounts. Comprehensive (or benchmark) updates are carried out at about 5-year intervals and incorporate major periodic source data, as well as major conceptual improvements.

The table below shows the average revisions to the quarterly percent changes in real GDP between different estimate vintages, without regard to sign.

	Average Revision Without Regard to Sign
Vintage	(percentage points, annual rates)
Advance to second	0.5
Advance to third	0.6
Second to third	0.2
Advance to latest	1.2

Note - Based on estimates from 1993 through 2017. For more information on GDP updates, see <u>Revision Information</u> on the BEA Web site.

The larger average revision from the advance to the latest estimate reflects the fact that periodic comprehensive updates include major statistical and methodological improvements.

Unlike GDP, an advance current quarterly estimate of GDI is not released because data on domestic profits and on net interest of domestic industries are not available. For fourth quarter estimates, these data are not available until the third estimate.

 $^{1. \} Real\ gross\ domestic\ income\ deflated\ by\ the\ implicit\ price\ deflator\ for\ gross\ domestic\ product.$

Note. Users are cautioned that particularly for components that exhibit rapid change in prices relative to other prices in the economy, the chained-dollar estimates should not be used to measure the component's relative importance or its contribution to the growth rate of more aggregate series. For accurate estimates of the contributions to percent changes in real gross domestic product, use table 2.

^{1.} Food excludes personal consumption expenditures for purchased meals and beverages, which are classified in food services.

2. This index is a supplemental measure that is based on household expenditures for which there are observable price measures. It excludes most implicit prices (for example, financial services furnished without payment) and the final consumption expenditures of nonprofit institutions serving households.

^{1.} Gross domestic income deflated by the implicit price deflator for gross domestic product.

^{2.} Food excludes personal consumption expenditures for purchased meals and beverages, which are classified in food services.

^{3.} This index is a supplemental measure that is based on household expenditures for which there are observable price measures. It excludes most implicit prices (for example, financial services furnished without payment)

and the final consumption expenditures of nonprofit institutions serving households.

Note. Estimates under the *Percent change from the preceding year* columns are calculated from annual data. Estimates under the *Percent change fourth quarter to fourth quarter t* quarter values relative to the same quarter one year prior.

^{1.} Gross domestic income deflated by the implicit price deflator for gross domestic product.

^{2.} Food excludes personal consumption expenditures for purchased meals and beverages, which are classified in food services.

^{3.} This index is a supplemental measure that is based on household expenditures for which there are observable price measures. It excludes most implicit prices (for example, financial services furnished without payment) and the final consumption expenditures of nonprofit institutions serving households.
