BEA 04-39

GROSS DOMESTIC PRODUCT: SECOND QUARTER 2004 (PRELIMINARY) CORPORATE PROFITS: SECOND QUARTER 2004 (PRELIMINARY)

Real gross domestic product -- the output of goods and services produced by labor and property located in the United States -- increased at an annual rate of 2.8 percent in the second quarter of 2004, according to preliminary estimates released by the Bureau of Economic Analysis. In the first quarter, real GDP increased 4.5 percent.

The GDP estimates released today are based on more complete source data than were available for the advance estimates issued last month. In the advance estimates, the increase in real GDP was 3.0 percent (see "Revisions" on page 3).

The major contributors to the increase in real GDP in the second quarter were personal consumption expenditures (PCE), equipment and software, residential fixed investment, private inventory investment, and government spending. Imports, which are a subtraction in the calculation of GDP, increased.

The deceleration in real GDP growth in the second quarter primarily reflected decelerations in PCE and in private inventory investment and an acceleration in imports that were partly offset by accelerations in residential fixed investment and in equipment and software and an upturn in nonresidential structures.

Motor vehicle output subtracted 0.76 percentage point from the second-quarter change in real GDP after contributing 0.30 percentage point to the first-quarter change.

The price index for gross domestic purchases, which measures prices paid by U.S. residents, increased 3.5 percent in the second quarter, the same as the advance estimate; this index increased 3.4 percent in the first quarter. Excluding food and energy prices, the price index for gross domestic purchases increased 2.5 percent in the second quarter, the same increase as in the first.

NOTE.--Quarterly estimates are expressed at seasonally adjusted annual rates, unless otherwise specified. Quarter-to-quarter dollar changes are differences between these published estimates. Percent changes are calculated from unrounded data and annualized. "Real" estimates are in chained (2000) dollars. Price indexes are chain-type measures.

This news release is available on BEA's Web site at <www.bea.gov/bea/rels.htm>.

Real personal consumption expenditures increased 1.6 percent in the second quarter, compared with an increase of 4.1 percent in the first. Real nonresidential fixed investment increased 12.1 percent, compared with an increase of 4.2 percent. Nonresidential structures increased 7.1 percent, in contrast to a decrease of 7.6 percent. Equipment and software increased 13.6 percent, compared with an increase of 8.0 percent. Real residential fixed investment increased 14.7 percent, compared with an increase of 5.0 percent.

Real exports of goods and services increased 6.1 percent in the second quarter, compared with an increase of 7.3 percent in the first. Real imports of goods and services increased 14.1 percent, compared with an increase of 10.6 percent.

Real federal government consumption expenditures and gross investment increased 2.7 percent in the second quarter, compared with an increase of 7.1 percent in the first. National defense increased 1.9 percent, compared with an increase of 10.6 percent. Nondefense increased 4.5 percent, compared with an increase of 0.2 percent. Real state and local government consumption expenditures and gross investment increased 2.2 percent, compared with no change in the first.

The real change in private inventories added 0.66 percentage point to the second-quarter change in real GDP, after adding 1.17 percentage points to the first-quarter change. Private businesses increased inventories \$57.7 billion in the second quarter, following increases of \$40.0 billion in the first and \$8.6 billion in the fourth quarter of 2003.

Real final sales of domestic product -- GDP less change in private inventories -- increased 2.1 percent in the second quarter, compared with an increase of 3.3 percent in the first.

Gross domestic purchases

Real gross domestic purchases -- purchases by U.S. residents of goods and services wherever produced -- increased 4.0 percent in the second quarter, compared with an increase of 5.0 percent in the first.

Gross national product

Real gross national product -- the goods and services produced by the labor and property supplied by U.S. residents -- increased 1.4 percent in the second quarter, compared with an increase of 3.9 percent in the first. GNP includes, and GDP excludes, net receipts of income from the rest of the world, which decreased \$37.6 billion in the second quarter after decreasing \$13.4 billion in the first; in the second quarter, receipts increased \$3.0 billion, and payments increased \$40.6 billion.

Current-dollar GDP

Current-dollar GDP -- the market value of the nation's output of goods and services -- increased 6.1 percent, or \$170.5 billion, in the second quarter to a level of \$11,643.1 billion. In the first quarter, current-dollar GDP increased 7.4 percent, or \$201.7 billion.

Revisions

The preliminary estimate of the second-quarter increase in real GDP is 0.2 percentage point, or \$6.6 billion, lower than the advance estimate issued last month. The downward revision to the percent change in real GDP primarily reflected a downward revision to exports and an upward revision to imports that were partly offset by upward revisions to PCE, to private inventory investment, and to equipment and software.

	<u>Advance</u> (Percent change from preceding quarter)	<u>Preliminary</u>
Real GDP.....	3.0	2.8
Current-dollar GDP.....	6.3	6.1
Gross domestic purchases price index...	3.5	3.5

Corporate Profits

Profits from current production (corporate profits with inventory valuation and capital consumption adjustments) increased \$1.6 billion in the second quarter. In the first quarter, profits increased \$36.5 billion. Current-production cash flow (net cash flow with inventory valuation and capital consumption adjustments) -- the internal funds available to corporations for investment -- decreased \$11.4 billion in the second quarter, in contrast to an increase of \$5.9 billion in the first.

Taxes on corporate income increased \$12.9 billion in the second quarter, compared with an increase of \$4.2 billion in the first. Profits after tax with inventory valuation and capital consumption adjustments decreased \$11.3 billion in the second quarter, after increasing \$32.3 billion in the first. Dividends increased \$10.0 billion, compared with an increase of \$7.0 billion; current-production undistributed profits decreased \$21.3 billion, in contrast to an increase of \$25.3 billion.

Domestic profits increased \$25.1 billion in the second quarter, compared with an increase of \$47.0 billion in the first. Domestic profits of financial corporations decreased \$3.6 billion in the second quarter, in contrast to an increase of \$19.8 billion in the first. Domestic profits of nonfinancial corporations increased \$28.7 billion in the second quarter, compared with an increase of \$27.3 billion in the first. In the second quarter, both real gross value added and profits per unit of real gross value added increased. The second quarter increase in unit profits reflected a larger increase in the prices corporations received than in the unit costs they incurred; unit labor costs increased while unit nonlabor costs were unchanged.

The foreign component of profits (rest-of-the-world profits) decreased \$23.5 billion in the second quarter, compared with a decrease of \$10.5 billion in the first. This measure is calculated as (1) receipts by U.S. residents of earnings from their foreign affiliates plus dividends received by U.S. residents from unaffiliated foreign corporations minus (2) payments by U.S. affiliates of earnings to their foreign parents plus dividends paid by U.S. corporations to unaffiliated foreign residents. The second-quarter decrease was accounted for by a large increase in payments and a small decrease in receipts.

Profits before tax with inventory valuation adjustment is the best available measure of industry profits because estimates of the capital consumption adjustment by industry do not exist. This measure reflects the depreciation-accounting practices used for federal income tax returns. According to this measure, domestic profits of financial corporations decreased, and domestic profits of nonfinancial corporations increased. Increases in profits of nonfinancial corporations were widespread among major industry groups with the largest occurring in information and in durable goods manufacturing; only utilities and retail trade decreased.

Profits before tax increased \$18.0 billion in the second quarter, in contrast to a decrease of \$3.8 billion in the first. The before-tax measure of profits does not reflect, as does profits from current production, the capital consumption and inventory valuation adjustments. These adjustments convert depreciation of fixed assets and inventory withdrawals reported on a tax-return, historical-cost basis to the current-cost measures used in the national income and product accounts. The capital consumption adjustment decreased \$6.2 billion in the second quarter (from \$240.2 billion to \$234.0 billion), in contrast to an increase of \$53.0 billion in the first. The inventory valuation adjustment decreased \$10.2 billion (from -\$37.0 billion to -\$47.2 billion), compared with a decrease of \$12.7 billion.

^r Revised. Revisions include changes to series affected by the introduction of revised wage and salary estimates for the first quarter of 2004.

1. Effective with the estimates scheduled for release on November 30, 2004, chained-dollar gross value added of nonfinancial corporate business for 1929 to 2004 will be revised. The current-dollar value added will be deflated by a revised chain-type price index calculated using the gross value added chain-type price index for nonfinancial industries from the comprehensive revision to the GDP-by-industry accounts.

2. Chained-dollar consumption of fixed capital of nonfinancial corporate business is calculated as the product of the chain-type quantity index and the 2000 current-dollar value of the corresponding series, divided by 100.

3. Chained-dollar net value added of nonfinancial corporate business is the difference between the gross value added and the consumption of fixed capital.

4. The deflator for gross value added of nonfinancial corporate business divided by 100.

NOTE.—Estimates in this table are based on the 1997 North American Industry Classification System (NAICS).

r Revised.

1. For some components of final sales of computers, includes computer parts.

2. Farm output less intermediate goods and services purchased.

3. Consists of GDP less gross value added of farm, of households and institutions, and of general government.

See "Explanatory Note" at the end of the tables.

Explanatory Note: NIPA Measures of Quantities and Prices

Current-dollar GDP is a measure of the market value of goods, services, and structures produced in the economy in a particular period. Changes in current-dollar GDP can be decomposed into quantity and price components. Quantities, or "real" measures, and prices are expressed as index numbers with the reference year -- at present, the year 2000 -- equal to 100.

Annual changes in quantities and prices are calculated using a Fisher formula that incorporates weights from two adjacent years. (Quarterly changes in quantities and prices are calculated using a Fisher formula that incorporates weights from two adjacent quarters; quarterly indexes are adjusted for consistency to the annual indexes before percent changes are calculated.) For example, the 2002-03 annual percent change in real GDP uses prices for 2002 and 2003 as weights, and the 2002-03 annual percent change in GDP prices uses quantities for 2002 and 2003 as weights. These annual changes are "chained" (multiplied) together to form time series of quantity and price indexes. Percent changes in Fisher indexes are not affected by the choice of reference year. (BEA also publishes a measure of the price level known as the implicit price deflator (IPD), which is calculated as the ratio of the current-dollar value to the corresponding chained-dollar value, multiplied by 100. The values of the IPD are very close to the values of the corresponding "chain-type" price index.)

Index numbers of quantity and price indexes for GDP and its major components are presented in this release in tables 5 and 6. Percent changes from the preceding period are presented in tables 1, 4, 7, and 8. Contributions by major components to changes in real GDP are presented in table 2.

Measures of real GDP and its major components are also presented in dollar-denominated form, designated "chained (2000) dollar estimates." For most series, these estimates, which are presented in table 3, are computed by multiplying the current-dollar value in 2000 by a corresponding quantity index number and then dividing by 100. For example, if a current-dollar GDP component equaled \$100 in 2000 and if real output for this component increased 10 percent in 2001, then the chained (2000) dollar value of this component in 2001 would be \$110 ($= \$100 \times 110 / 100$). Percent changes calculated from chained-dollar estimates and from chain-type quantity indexes are the same; any differences will be small and due to rounding.

Chained-dollar values for the detailed GDP components will not necessarily sum to the chained-dollar estimate of GDP (or to any intermediate aggregate). This is because the relative prices used as weights for any period other than the reference year differ from those of the reference year. A measure of the extent of such differences is provided by a "residual" line, which indicates the difference between GDP (or other major aggregate) and the sum of the most detailed components in the table. For periods close to the reference year, when there usually has not been much change in the relative prices that are used as weights, the residuals tend to be small, and the chained-dollar estimates can be used to approximate the contributions to growth and to aggregate the detailed estimates. For periods further from the reference year, the residuals tend to be larger, and the chained-dollar estimates are less useful for analyses of contributions to growth. Thus, the contributions to percent change shown in table 2 provide a better measure of the composition of GDP growth. In particular, for components for which relative prices are changing rapidly, calculation of contributions using chained-dollar estimates may be misleading even just a few years from the reference year.
