

News Release

EMBARGOED UNTIL RELEASE AT 8:30 A.M. EDT, WEDNESDAY, SEPTEMBER 30, 2020 BEA 20-48

Technical: Lisa Mataloni (GDP) (301) 278-9083 gdpniwd@bea.gov

Kate Pinard (Corporate Profits) (301) 278-9417 <u>cpniwd@bea.gov</u>

Media: Jeannine Aversa (301) 278-9003 <u>Jeannine.Aversa@bea.gov</u>

Gross Domestic Product (Third Estimate), Corporate Profits (Revised), and GDP by Industry, Second Quarter 2020

Real gross domestic product (GDP) decreased at an annual rate of 31.4 percent in the second quarter of 2020 (table 1), according to the "third" estimate released by the Bureau of Economic Analysis. In the first quarter, real GDP decreased 5.0 percent.

The "third" estimate of GDP released today is based on more complete source data than were available for the "second" estimate issued last month. In the second estimate, the decrease in real GDP was 31.7 percent. The upward revision with the third estimate primarily reflected an upward revision to personal consumption expenditures (PCE) that was partly offset by downward revisions to exports and to nonresidential fixed investment (see "Updates to GDP" on page 3).

Coronavirus (COVID-19) Impact on the Second-Quarter 2020 GDP Estimate

The decline in second quarter GDP reflected the response to COVID-19, as "stay-at-home" orders issued in March and April were partially lifted in some areas of the country in May and June, and government pandemic assistance payments were distributed to households and businesses. This led to rapid shifts in activity, as businesses and schools continued remote work and consumers and businesses canceled, restricted, or redirected their spending. The full economic effects of the COVID-19 pandemic cannot be quantified in the GDP estimate for the second quarter of 2020 because the impacts are generally embedded in source data and cannot be separately identified. For more information, see the Technical Note.

The decrease in **real GDP** reflected decreases in PCE, exports, nonresidential fixed investment, private inventory investment, residential fixed investment, and state and local government spending that were partly offset by an increase in federal government spending. Imports, which are a subtraction in the calculation of GDP, decreased (table 2).

The decrease in PCE reflected decreases in services (led by health care) and goods (led by clothing and footwear). The decrease in exports primarily reflected a decrease in goods (led by capital goods). The decrease in nonresidential fixed investment primarily reflected a decrease in equipment (led by transportation equipment). The decrease in private inventory investment primarily reflected a decrease in retail (led by motor vehicle dealers). The decrease in residential investment primarily reflected decreases in new single-family housing.

Current-dollar GDP decreased 32.8 percent, or \$2.04 trillion, in the second quarter to a level of \$19.52 trillion. In the first quarter, GDP decreased 3.4 percent, or \$186.3 billion (tables 1 and 3). More information on the source data that underlie the estimates is available in the "Key Source Data and Assumptions" file on BEA's website.

The **price index for gross domestic purchases** decreased 1.4 percent in the second quarter, in contrast to an increase of 1.4 percent in the first quarter (table 4). **The PCE price index** decreased 1.6 percent, in contrast to an increase of 1.3 percent. Excluding food and energy prices, the PCE price index decreased 0.8 percent, in contrast to an increase of 1.6 percent.

Gross Domestic Income and Corporate Profits

Real gross domestic income (GDI) decreased 33.5 percent in the second quarter, compared with a decrease of 2.5 percent in the first quarter. The **average of real GDP and real GDI**, a supplemental measure of U.S. economic activity that equally weights GDP and GDI, decreased 32.5 percent in the second quarter, compared with a decrease of 3.7 percent in the first quarter (table 1).

Profits from current production (corporate profits with inventory valuation and capital consumption adjustments) decreased \$208.9 billion in the second quarter, compared with a decrease of \$276.2 billion in the first quarter (table 10).

Profits of domestic financial corporations increased \$26.5 billion in the second quarter, in contrast to a decrease of \$42.2 billion in the first quarter. **Profits of domestic nonfinancial corporations** decreased \$145.9 billion, compared with a decrease of \$190.5 billion. **Rest-of-the-world profits** decreased \$89.5 billion, compared with a decrease of \$43.5 billion. In the second quarter, receipts decreased \$134.5 billion, and payments decreased \$45.0 billion.

Updates to GDP

In the third estimate, the second-quarter change in real GDP was revised up 0.3 percentage point from the second estimate. PCE, residential investment, and state and local government spending were revised up. These upward revisions were partly offset by downward revisions to exports and to private nonresidential fixed investment (mainly intellectual property products). For more information, see the Technical Note and the "Additional Information" section that follows.

	Advance Estimate	Second Estimate	Third Estimate
	(Percent cl	nange from precedin	g quarter)
Real GDP	-32.9	-31.7	-31.4
Current-dollar GDP	-34.3	-33.3	-32.8
Real GDI		-33.1	-33.5
Average of Real GDP and Real GDI		-32.4	-32.5
Gross domestic purchases price index	-1.5	-1.5	-1.4
PCE price index	-1.9	-1.8	-1.6
PCE price index excluding food and energy	-1.1	-1.0	-0.8

Bringing Together National, Industry, and State GDP Statistics

BEA has accelerated the release of its industry and state GDP statistics to align with the quarterly estimates of national GDP. Starting with today's GDP release, GDP by industry statistics are issued on the same day — and in the same news release — as the third estimate of national GDP. GDP by state statistics will follow in a separate news release within two days. These three major dimensions of GDP are now synchronized to cover the same quarter, giving users a fuller and more timely view of the U.S. economy.

Real GDP by Industry

Today's release includes estimates of **GDP by industry**, or value added—a measure of an industry's contribution to GDP. Private goods-producing industries decreased 34.4 percent, private services-producing industries decreased 33.1 percent, and government decreased 16.6 percent (table 12). Overall, 20 of 22 industry groups contributed to the second-quarter decline in real GDP.

Within private goods-producing industries, the leading contributor to the decrease was durable goods manufacturing (led by motor vehicles, bodies and trailers, and parts) (table 13).

Within private services-producing industries, the leading contributors to the decrease were accommodation and food services (led by food services and drinking places); health care and social assistance (led by ambulatory health care); transportation and warehousing (led by air transportation); arts, entertainment, and recreation; wholesale trade; and professional, scientific, and technical services. Offsetting these decreases was an increase in finance and insurance (led by the securities and banking industries).

The decrease in government was more than accounted for by a decrease in state and local government which was partly offset by an increase in federal government.

Gross Output by Industry

Real gross output—principally a measure of an industry's sales or receipts, which includes sales to final users in the economy (GDP) and sales to other industries (intermediate inputs)—decreased 29.5 percent in the second quarter. This reflected a decrease of 32.6 percent for private services-producing industries, a decrease of 29.7 percent for private goods-producing industries, and a decrease of 7.6 percent for government (table 16). Overall, 20 of 22 industry groups contributed to the decrease in real gross output. Finance and insurance as well as federal government gross output increased.

Annual Update of the Industry Economic Accounts

The industry estimates released today reflect the results of the 2020 Annual Update of the Industry Economic Accounts. The update covers the first quarter of 2015 through the first quarter of 2020. Major improvements introduced with this update include:

Incorporation of the results from the 2020 Annual Update of the National Income and Product
Accounts. For details on methodology improvements, major source data incorporated, and
results, see "The 2020 Annual Update of the National Income and Product Accounts" in the
August Survey of Current Business.

- Incorporation of newly available and revised source data, including the Census Bureau's Service Annual Survey (SAS), the Bureau of Labor Statistics' (BLS) Quarterly Census of Employment and Wages, and the Department of Treasury's Statistics of Income.
- Introduction of a new implicit price deflator for import duties recorded in wholesale trade that
 conceptually captures changes in both the price of the underlying duties as well as changes in
 duty rates to improve the deflation of customs duties.
- Adoption of several retail trade producer price indexes (PPIs) due to the discontinuation of various detailed retail trade industries in the BLS PPI program.
- Incorporation of new educational services output indicators based on SAS revenue and taxable and tax-exempt expense data.
- Adoption of new commercial fishing indicators for quarterly estimates from 2017 onward using BLS PPIs and Census Manufacturers' Shipments, Inventories, and Orders (M3) survey data due to the discontinuation of National Oceanic and Atmospheric Administration data on monthly commercial fishing landings and prices.

The full results of the annual update of the industry economic accounts, including updated annual supply-use tables, can be found on the <u>BEA Web site</u>. Additional information will be available in an article in the October 2020 issue of the *Survey of Current Business*.

- For detail on the three ways to measure GDP, see the Primer.

Definitions

Gross domestic product (GDP), or value added, is the value of the goods and services produced by the nation's economy less the value of the goods and services used up in production. GDP is also equal to the sum of personal consumption expenditures, gross private domestic investment, net exports of goods and services, and government consumption expenditures and gross investment.

Gross domestic income (GDI) is the sum of incomes earned and costs incurred in the production of GDP. In national economic accounting, GDP and GDI are conceptually equal. In practice, GDP and GDI differ because they are constructed using largely independent source data.

Gross output is the value of the goods and services produced by the nation's economy. It is principally measured using industry sales or receipts, including sales to final users (GDP) and sales to other industries (intermediate inputs).

Current-dollar estimates are valued in the prices of the period when the transactions occurred—that is, at "market value." Also referred to as "nominal estimates" or as "current-price estimates."

Real values are inflation-adjusted estimates—that is, estimates that exclude the effects of price changes.

The *gross domestic purchases price index* measures the prices of final goods and services purchased by U.S. residents.

The *personal consumption expenditure price index* measures the prices paid for the goods and services purchased by, or on the behalf of, "persons."

Personal income is the income received by, or on behalf of, all persons from all sources: from participation as laborers in production, from owning a home or business, from the ownership of financial assets, and from government and business in the form of transfers. It includes income from domestic sources as well as the rest of world. It does not include realized or unrealized capital gains or losses.

Disposable personal income is the income available to persons for spending or saving. It is equal to personal income less personal current taxes.

Personal outlays is the sum of personal consumption expenditures, personal interest payments, and personal current transfer payments.

Personal saving is personal income less personal outlays and personal current taxes.

The *personal saving rate* is personal saving as a percentage of disposable personal income.

Profits from current production, referred to as corporate profits with inventory valuation adjustment (IVA) and capital consumption (CCAdj) adjustment in the National Income and Product Accounts (NIPAs), is a measure of the net income of corporations before deducting income taxes that is consistent with the value of goods and services measured in GDP. The IVA and CCAdj are adjustments that convert inventory withdrawals and depreciation of fixed assets reported on a tax-return, historical-cost basis to the current-cost economic measures used in the national income and product accounts. Profits for domestic industries reflect profits for all corporations located within the geographic borders of the United States. The rest-ofthe-world (ROW) component of profits is measured as the difference between profits received from ROW and profits paid to ROW.

For more definitions, see the <u>Glossary: National Income and Product Accounts</u>.

Statistical conventions

Annual-vs-quarterly rates. Quarterly seasonally adjusted values are expressed at annual rates, unless otherwise specified. This convention is used for BEA's featured,

seasonally adjusted measures to facilitate comparisons with related and historical data. For details, see the FAQ "Why does BEA publish estimates at annual rates?"

Quarterly not seasonally adjusted values are expressed only at quarterly rates.

Percent changes. Percent changes in quarterly seasonally adjusted series are displayed at annual rates, unless otherwise specified. For details, see the FAQ "How is average annual growth calculated?" Percent changes in quarterly not seasonally adjusted values are calculated from the same quarter one year ago. All published percent changes are calculated from unrounded data.

Calendar years and quarters. Unless noted otherwise, annual and quarterly data are presented on a calendar basis.

Quantities and prices. Quantities, or "real" volume measures, and prices are expressed as index numbers with a specified reference year equal to 100 (currently 2012). Quantity and price indexes are calculated using a Fisherchained weighted formula that incorporates weights from two adjacent periods (quarters for quarterly data and annuals for annual data). For details on the calculation of quantity and price indexes, see Chapter 4: Estimating Methods in the NIPA Handbook.

Chained-dollar values are calculated by multiplying the quantity index by the current dollar value in the reference year (2012) and then dividing by 100. Percent changes calculated from real quantity indexes and chained-dollar levels are conceptually the same; any differences are due to rounding. Chained-dollar values are not additive because the relative weights for a given period differ from those of the reference year. In tables that display chained-dollar values, a "residual" line shows the difference between the sum of detailed chained-dollar series and its corresponding aggregate.

Updates to GDP

BEA releases three vintages of the current quarterly estimate for GDP: "Advance" estimates are released near the end of the first month following the end of the quarter and are based on source data that are incomplete or subject to further revision by the source agency; "second" and "third" estimates are released near the end of the second and third months, respectively, and are based on more detailed and more comprehensive data as they become available.

The table below shows the average revisions to the quarterly percent changes in real GDP between different estimate vintages, without regard to sign.

	Average Revision
	Without Regard to Sign
Vintage	(percentage points, annual rates)
Advance to second	0.5
Advance to third	0.6
Second to third	0.3

Note - Based on estimates from 1993 through 2019. For more information on GDP updates, see <u>Revision Information</u> on the BEA Web site.

Annual and comprehensive updates are typically released in late July. Annual updates generally cover at least the 5 most recent calendar years (and their associated quarters) and incorporate newly available major annual source data as well as some changes in methods and definitions to improve the accounts. Comprehensive (or benchmark) updates are carried out at about 5-year intervals and incorporate major periodic source data, as well as major conceptual improvements.

Unlike GDP, advance current quarterly estimates of GDI and corporate profits are not released because data on domestic profits and on net interest of domestic industries are not available. For fourth quarter estimates, these data are not available until the third estimate.

GDP by industry and gross output estimates are released with the third estimate of GDP.

r Revised

Note. Users are cautioned that particularly for components that exhibit rapid change in prices relative to other prices in the economy, the chained-dollar estimates should not be used to measure the component's relative importance or its contribution to the growth rate of more aggregate series. For accurate estimates of the contributions to percent changes in real gross domestic product, use table 2.

^{1.} Real gross domestic income is gross domestic income deflated by the implicit price deflator for gross domestic product.

Table 3. Gross Domestic Product: Level and Change from Preceding Period--Table Ends

r Revised

Note. Users are cautioned that particularly for components that exhibit rapid change in prices relative to other prices in the economy, the chained-dollar estimates should not be used to measure the component's relative importance or its contribution to the growth rate of more aggregate series. For accurate estimates of the contributions to percent changes in real gross domestic product, use table 2.

^{1.} Real gross domestic income is gross domestic income deflated by the implicit price deflator for gross domestic product.

Table 4. Price Indexes for Gross Domestic Product and Related Measures: Percent Change from Preceding Period

^{1.} Food excludes personal consumption expenditures for purchased meals and beverages, which are classified in food services.

^{2.} This index is a supplemental measure that is based on household expenditures for which there are observable price measures. It excludes most implicit prices (for example, financial services furnished without payment) and the final consumption expenditures of nonprofit institutions serving households.

^{1.} Gross domestic income deflated by the implicit price deflator for gross domestic product.

^{2.} Food excludes personal consumption expenditures for purchased meals and beverages, which are classified in food services.

^{3.} This index is a supplemental measure that is based on household expenditures for which there are observable price measures. It excludes most implicit prices (for example, financial services furnished without payment) and the final consumption expenditures of nonprofit institutions serving households.

Note. Estimates under the Percent change from the preceding year columns are calculated from annual data. Estimates under the Percent change from fourth quarter to fourth quarter columns are calculated from fourth quarter values relative to the same quarter one year prior.

^{1.} Personal income is also equal to national income less corporate profits with inventory valuation and capital consumption adjustments, taxes on production and imports less subsidies, contributions for government social insurance, net interest and miscellaneous payments, business current transfer payments (net), and current surplus of government enterprises, plus personal income receipts on assets, and personal current transfer receipts.

^{2.} The current-dollar measure is deflated by the implicit price deflator for personal consumption expenditures.

r Revised

^{1.} The current-dollar gross value added is deflated using the gross value added chain-type price index for nonfinancial industries from the GDP-by-industry accounts. For periods when this price index is not available, the chain-type price index for GDP goods and structures is used.

^{2.} Chained-dollar consumption of fixed capital of nonfinancial corporate business is calculated as the product of the chain-type quantity index and the 2012 current-dollar value of the corresponding series, divided by 100.

^{3.} Chained-dollar net value added of nonfinancial corporate business is the difference between the gross value added and the consumption of fixed capital.

^{4.} The deflator for gross value added of nonfinancial corporate business divided by 100.

Note. Estimates in this table are based on the 2012 North American Industry Classification System (NAICS).

^{1.} Consists of agriculture, forestry, fishing, and hunting; mining; construction; and manufacturing.
2. Consists of utilities; wholesale trade; retail trade; transportation and warehousing; information; finance, insurance, real estate, rental, and leasing; professional and business services; educational services, health care, and social assistance; arts,

entertainment, recreation, accommodation, and food services; and other services, except government.

Note. Percentage-point contributions do not sum to the percent change in real gross domestic product because the industry details are calculated using source data and methodologies that differ from those used to calculate growth in the top-line, expenditure-based measure of real GDP.
